Tools for Big Data

# Parallel computing

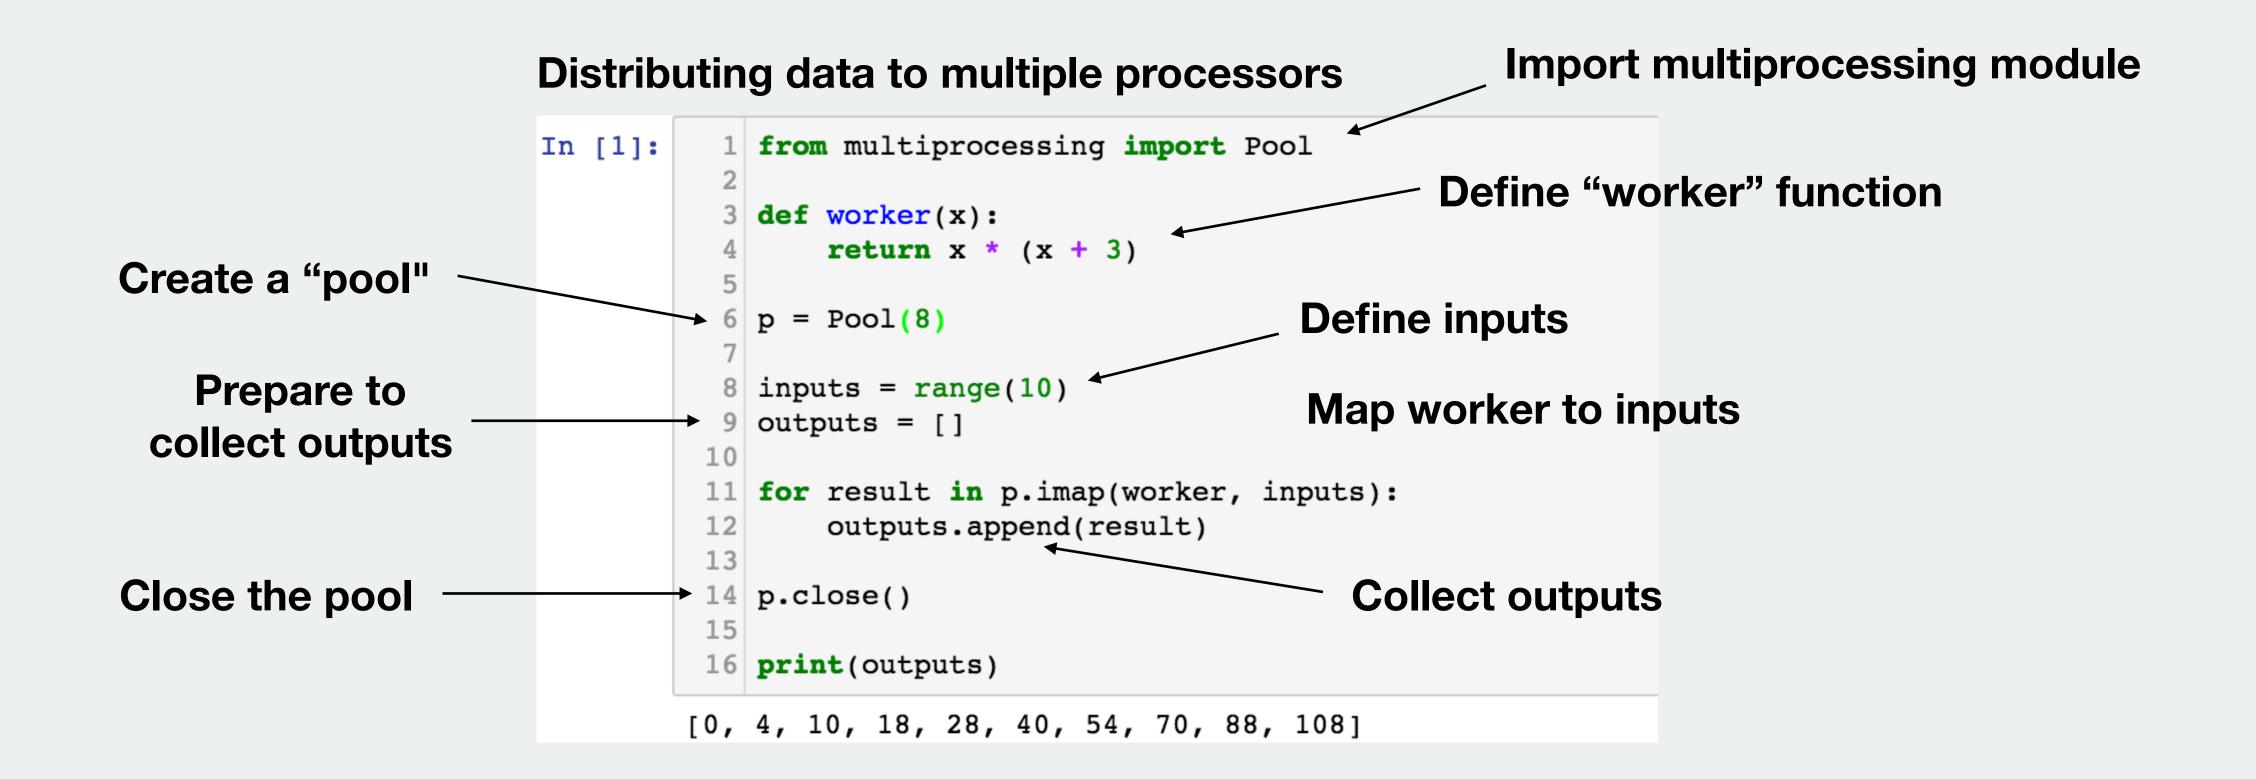

### Parallel computing

#### **Iterating over some data (for loop)**

#### Iterating over some data (mapping the computation onto the input)

#### Distributing data to multiple processors

#### **Pure Python equivalent**

#### **Pure Python equivalent**

# MapReduce

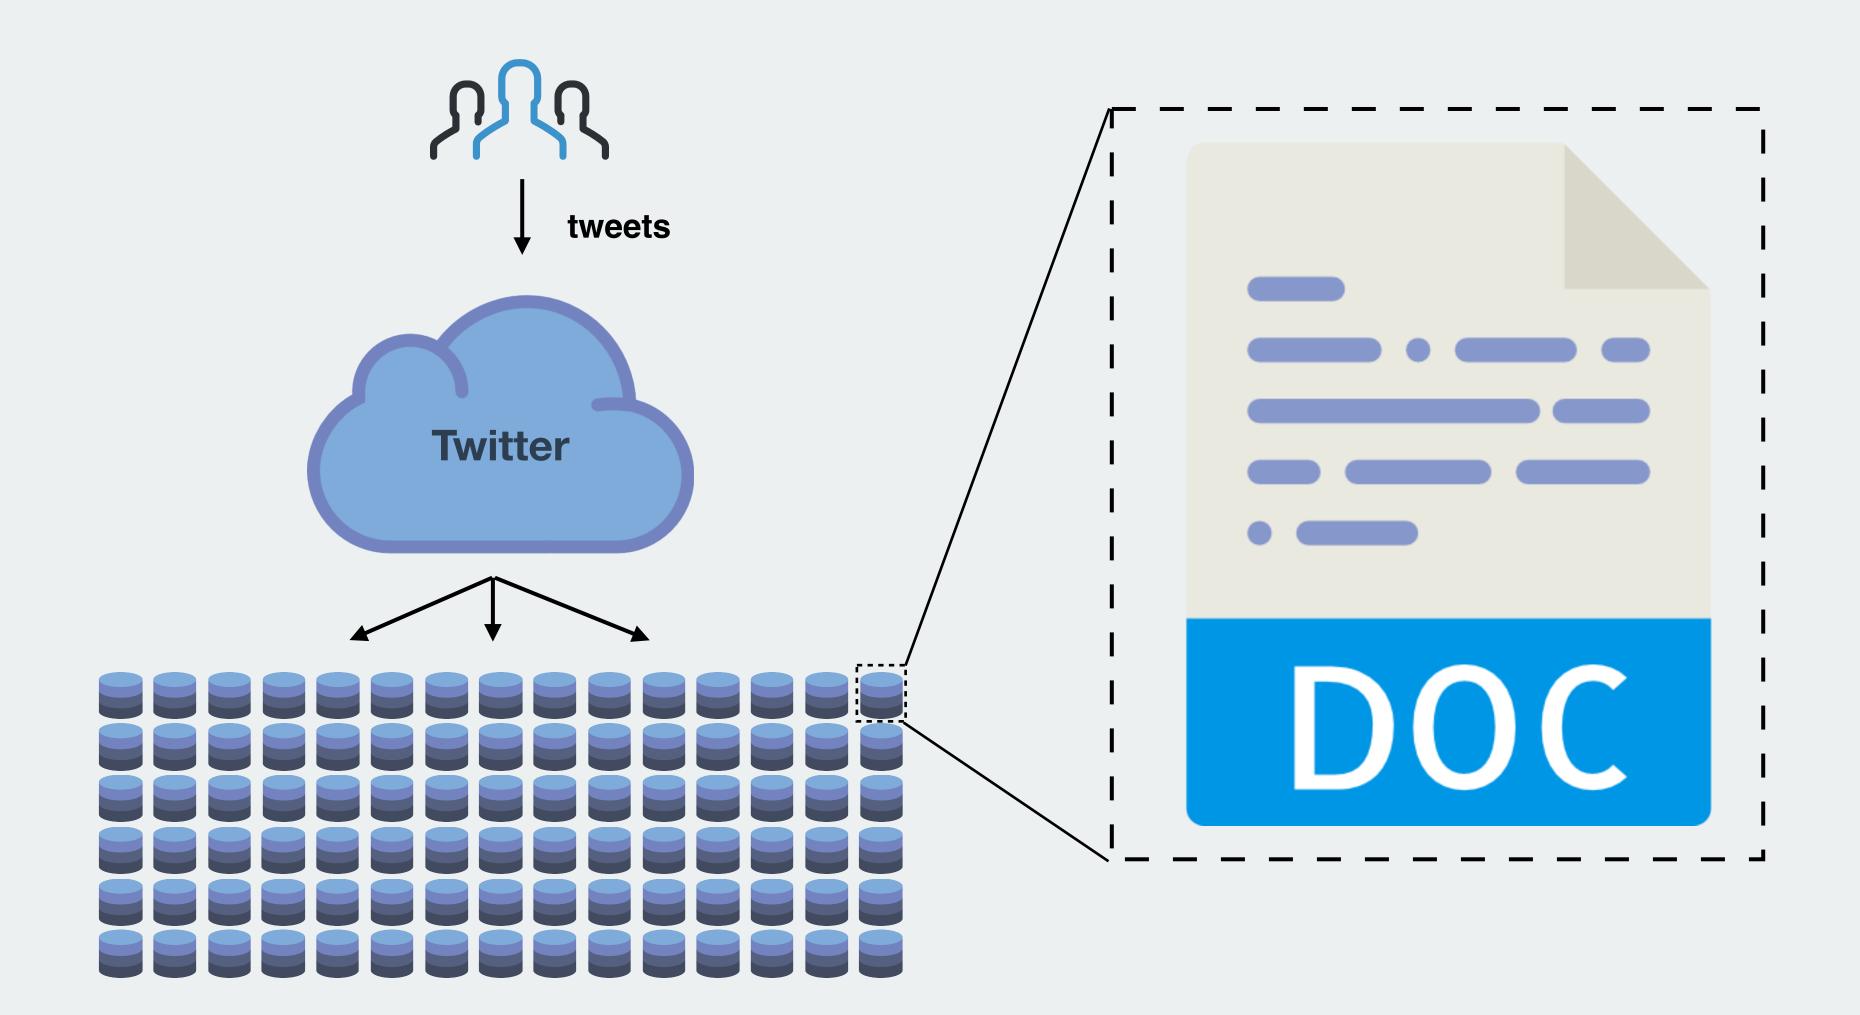

"MapReduce is a programming model and an associated implementation for processing and generating big data sets with a parallel, distributed algorithm on a cluster."

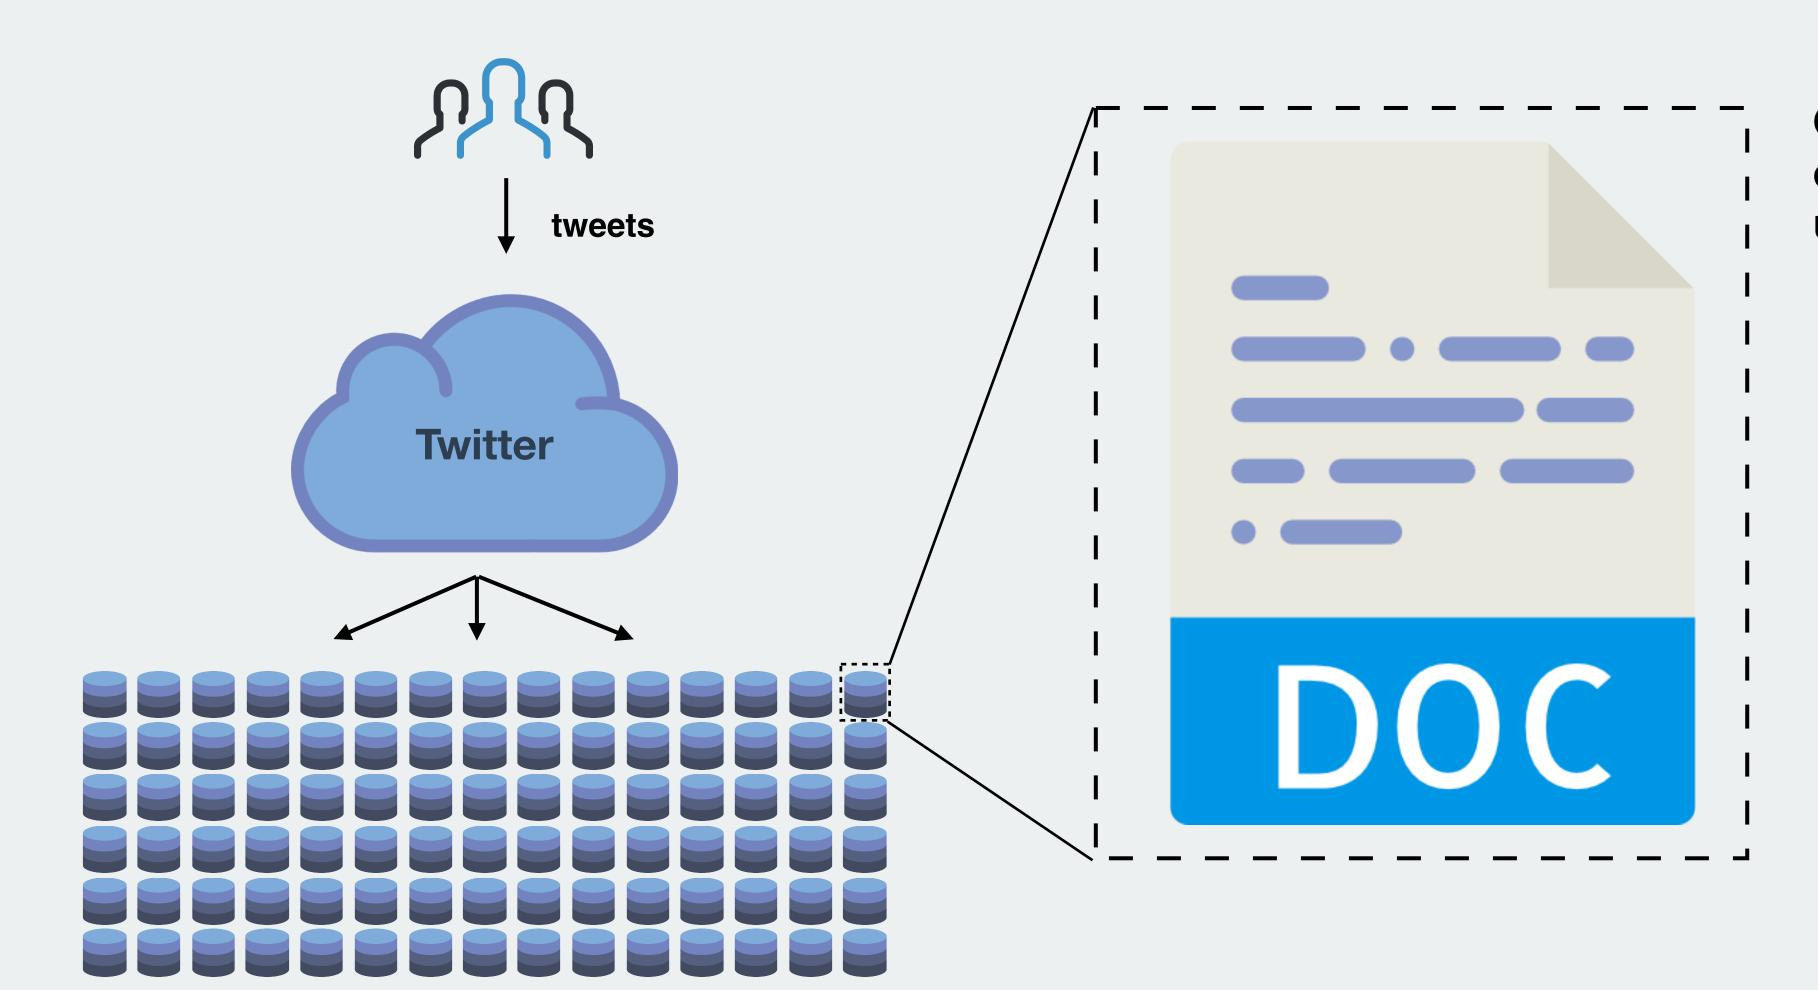

- Wikipedia

# MapReduce

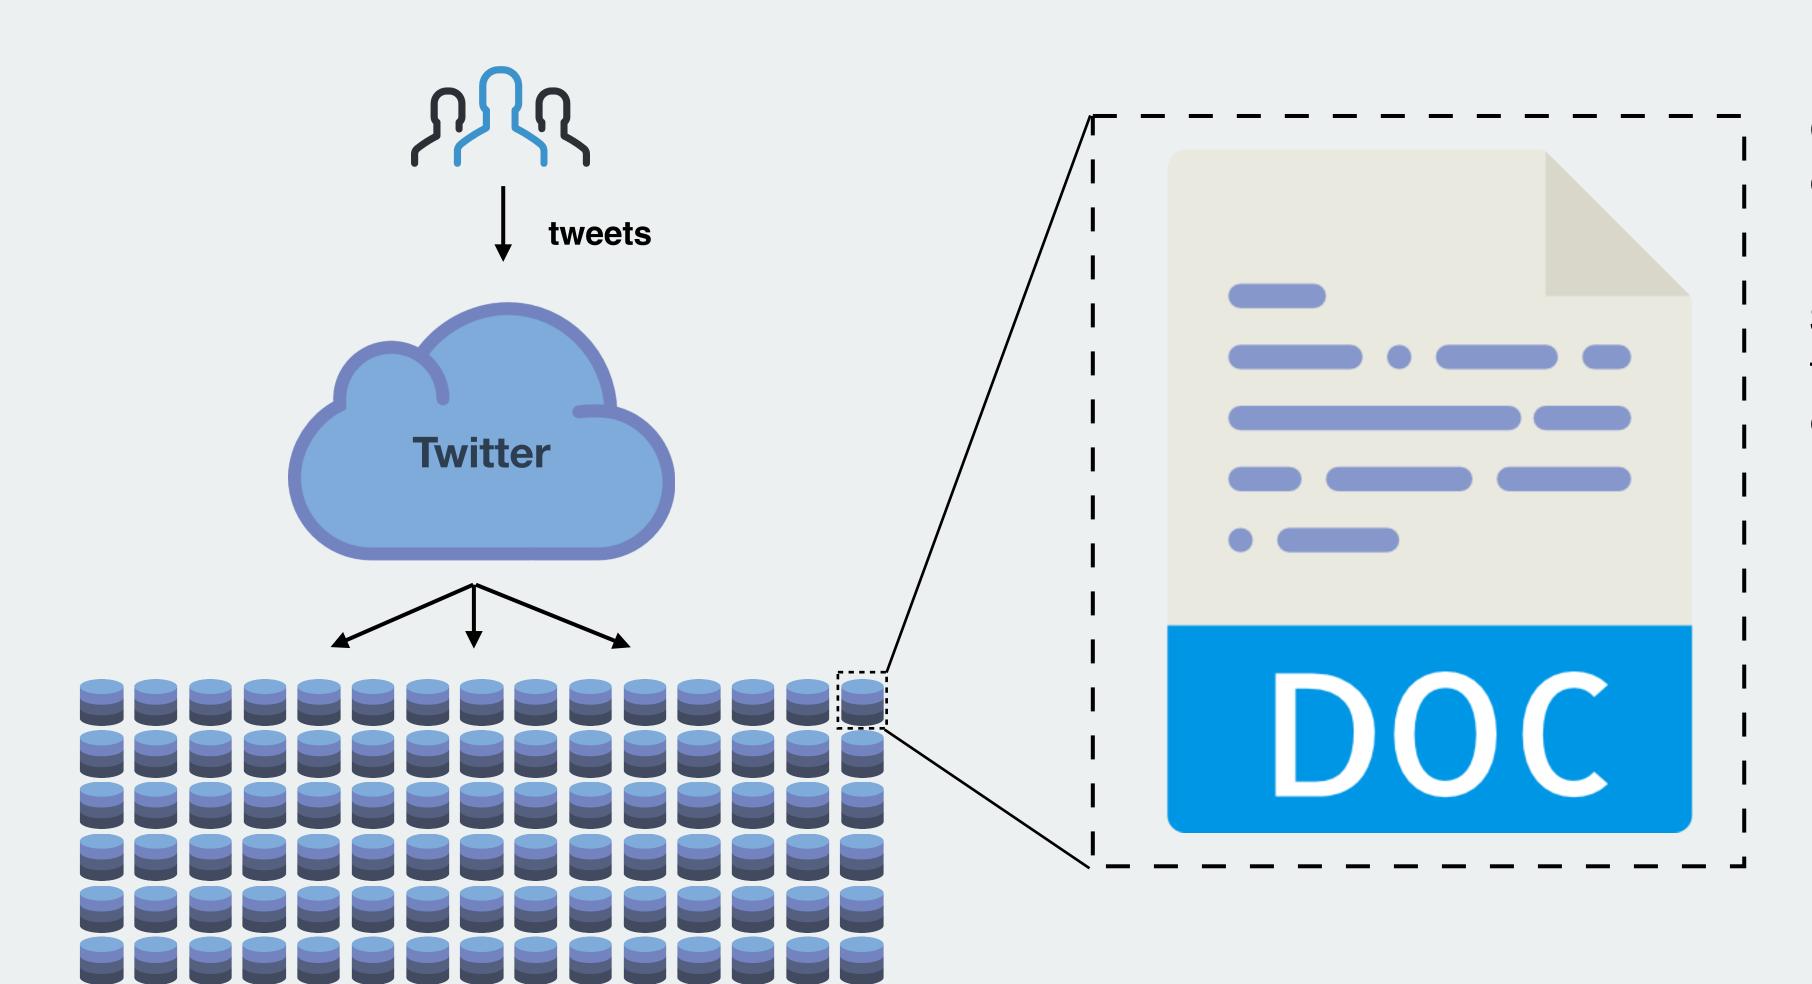

"MapReduce is a programming model and an associated implementation for processing and generating big data sets with a parallel, distributed algorithm on a cluster."

- Wikipedia

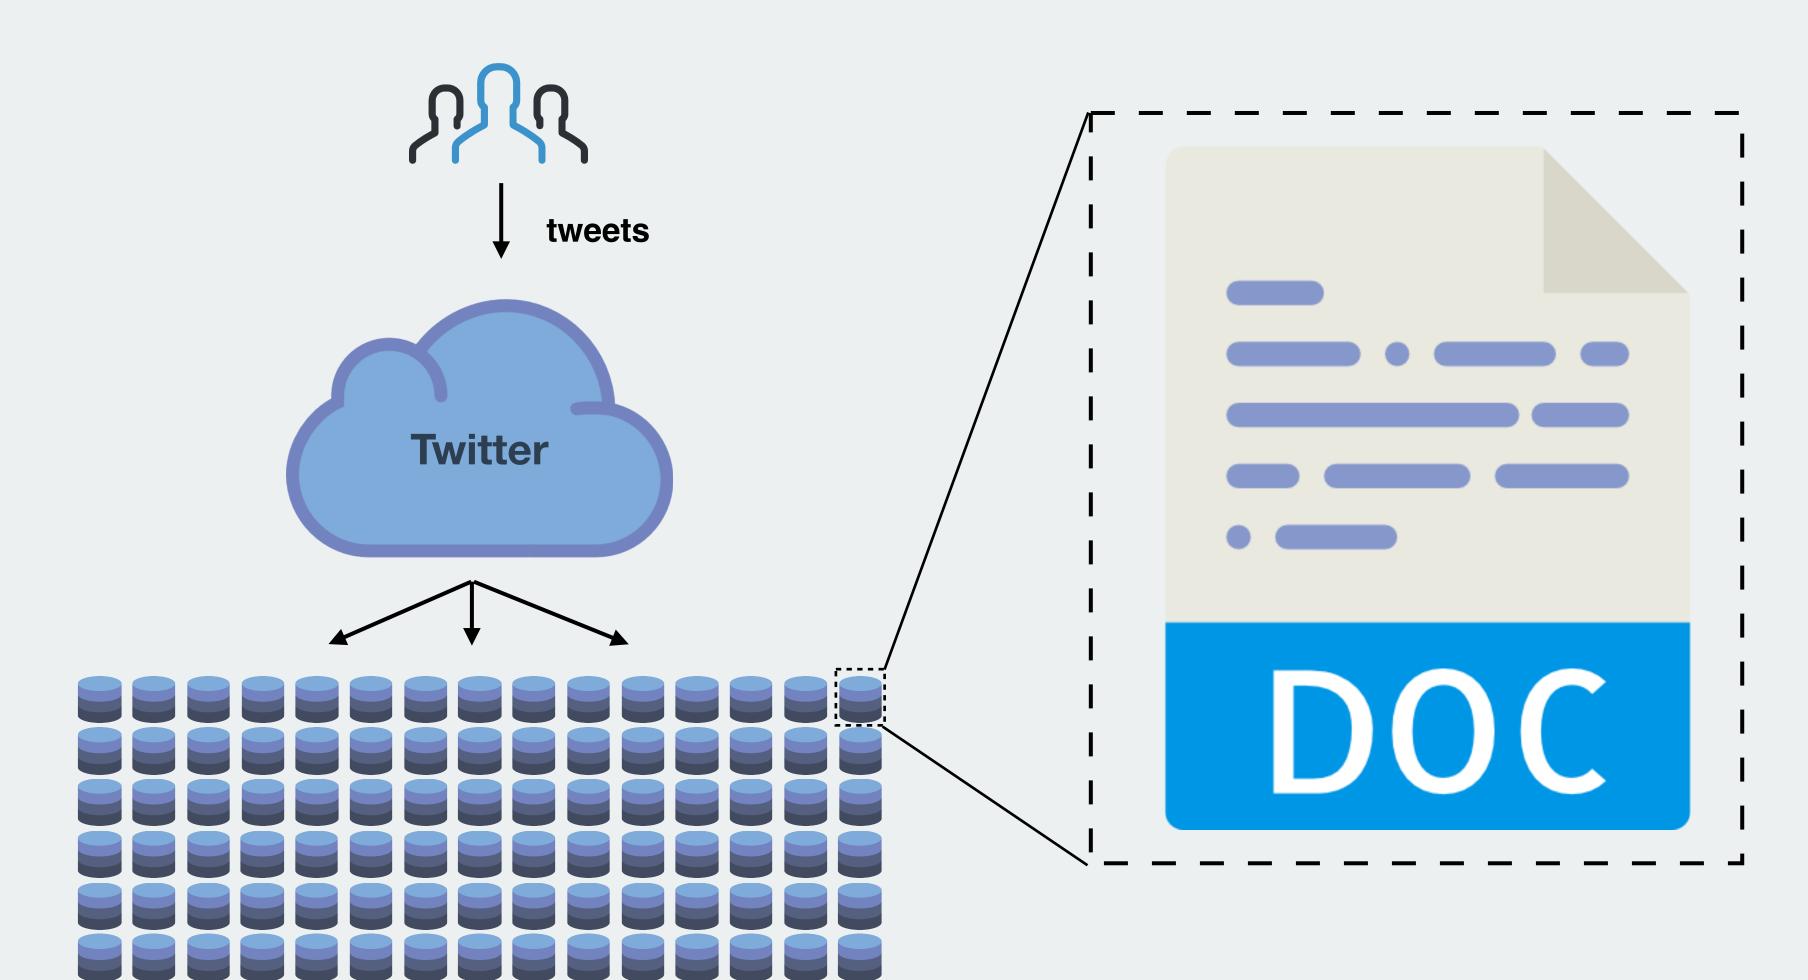

**Objective:** Count number of occurrences for each word used on twitter

**Objective:** Count number of occurrences for each word used on twitter

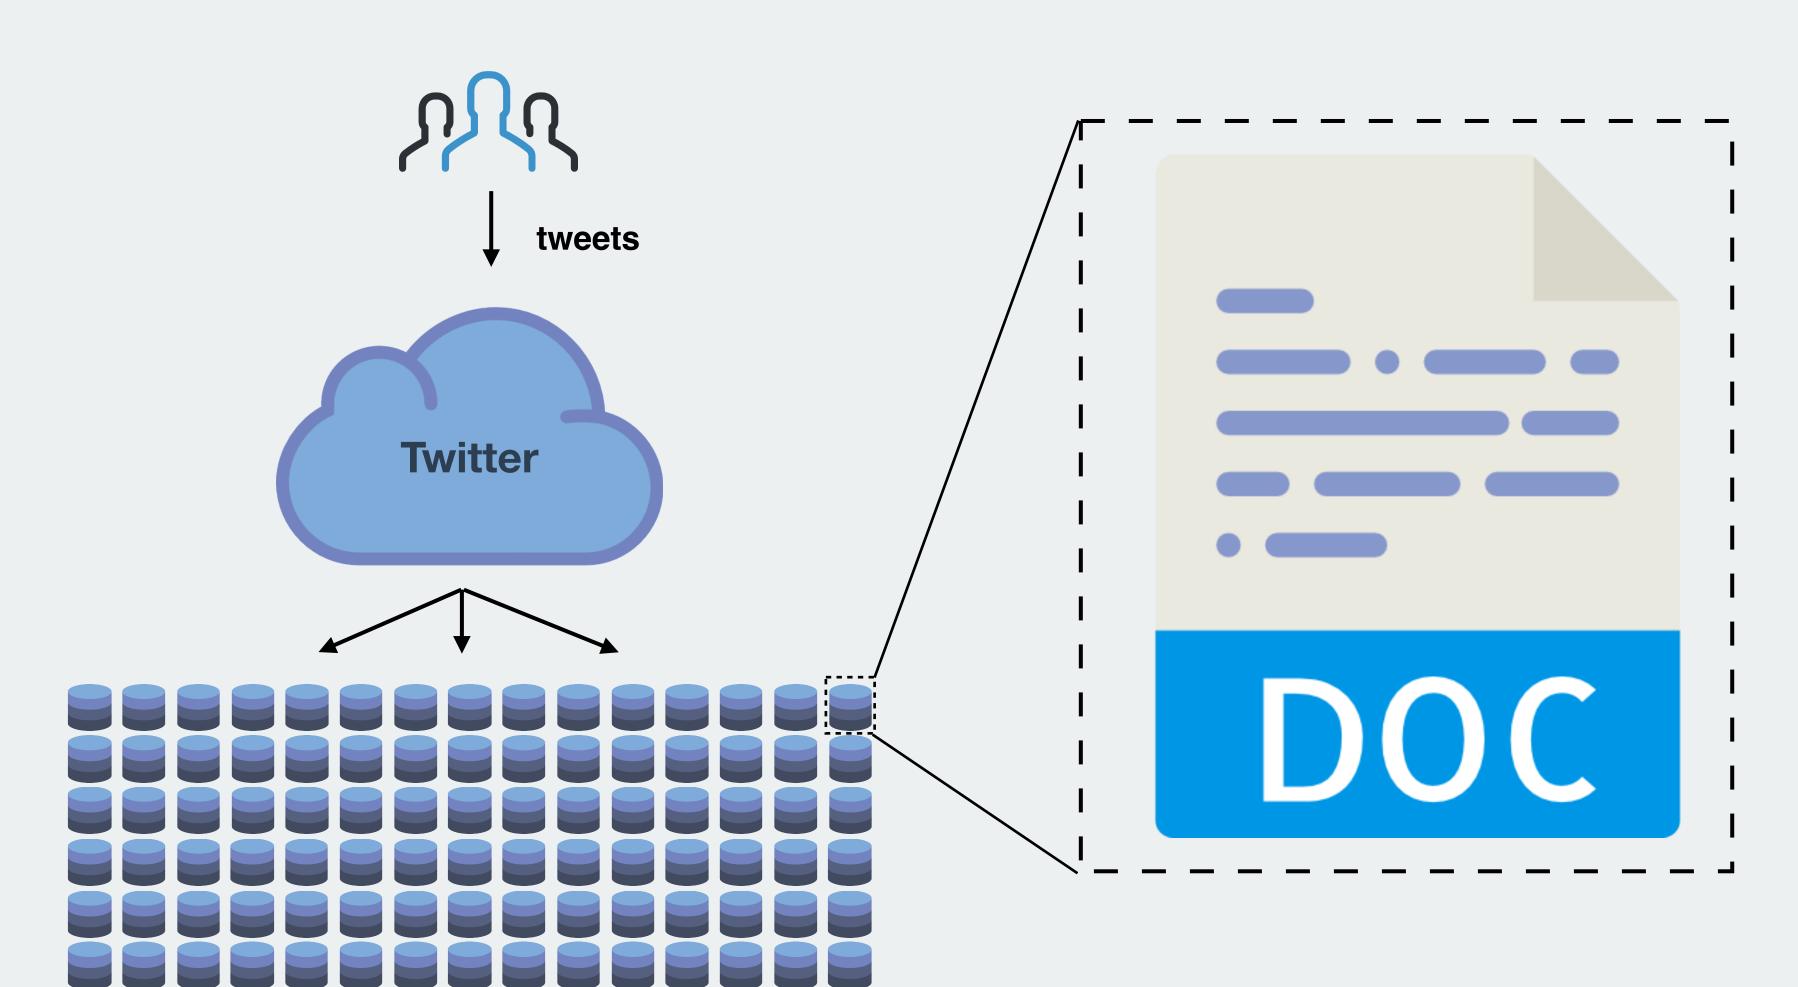

**Sequential:** Set a Python script to loop over databases and for each word in each document, increment the word's Counter.

**Objective:** Count number of occurrences for each word used on twitter

**Sequential:** Set a Python script to loop over databases and for each word in each document, increment the word's Counter.

**SLOW** 

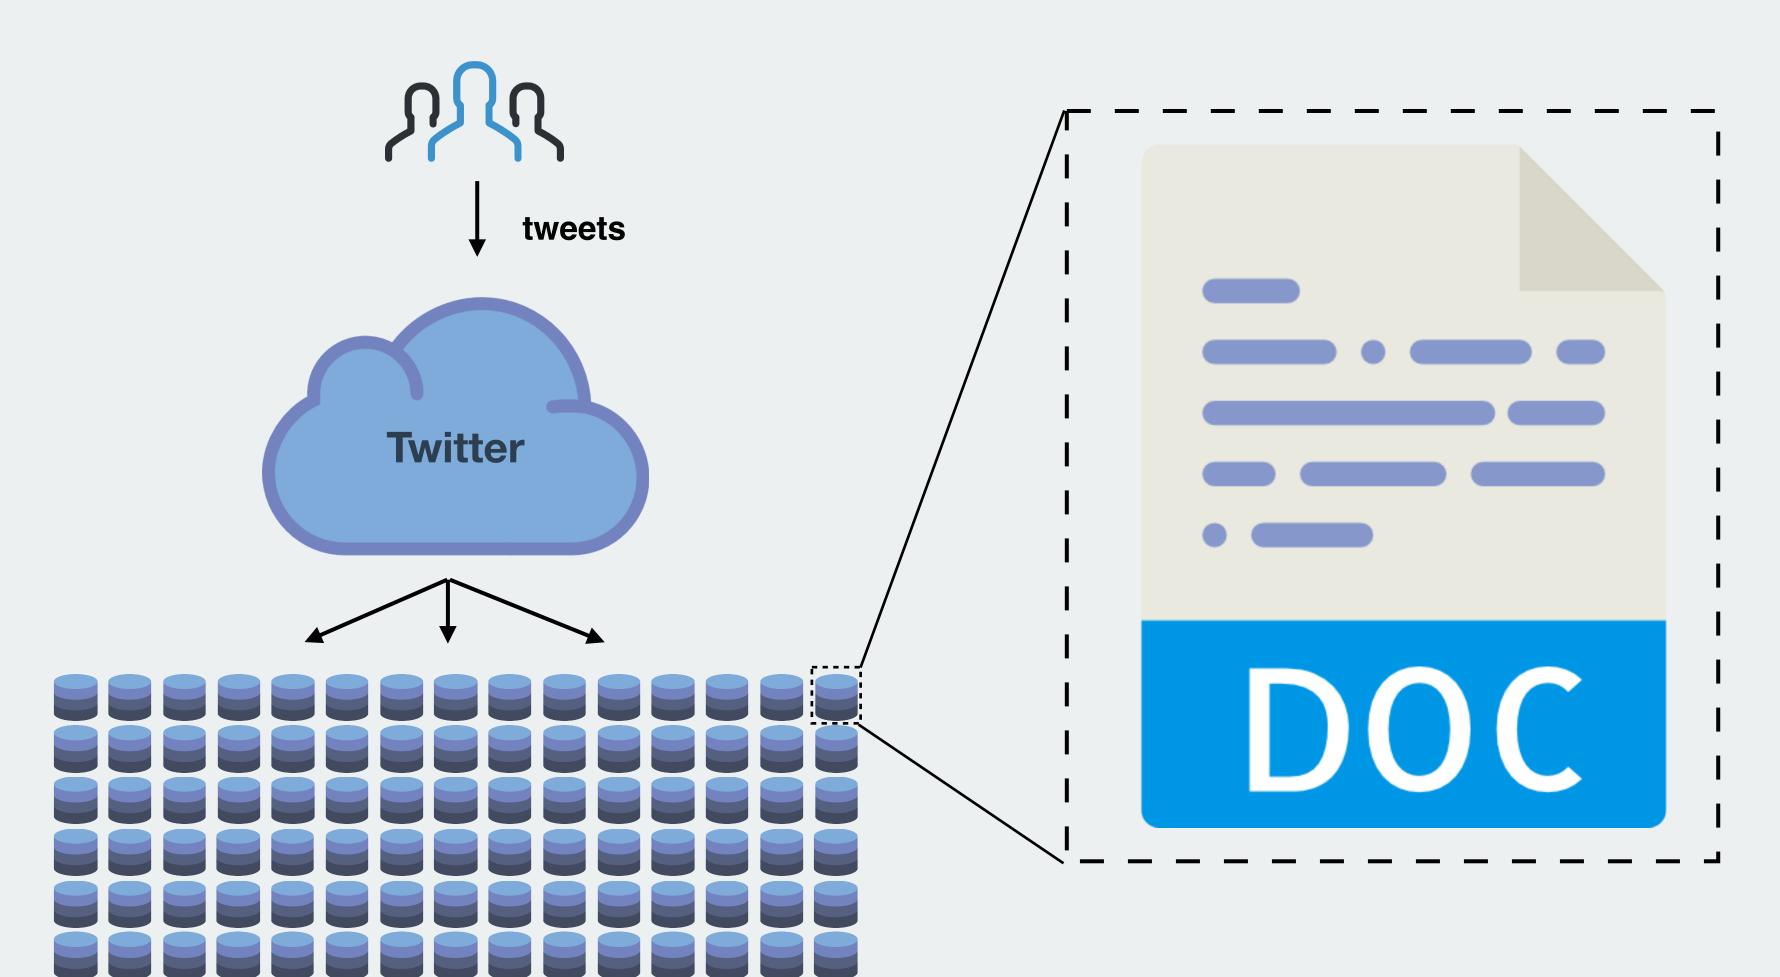

Objective: Count number of occurrences for each word used on twitter

**Sequential:** Set a Python script to loop over databases and for each word in each document, increment the word's Counter.

#### **SLOW**

Parallel: Send Python script to multiple databases at a time, which loops over words in the document and increments a central Counter.

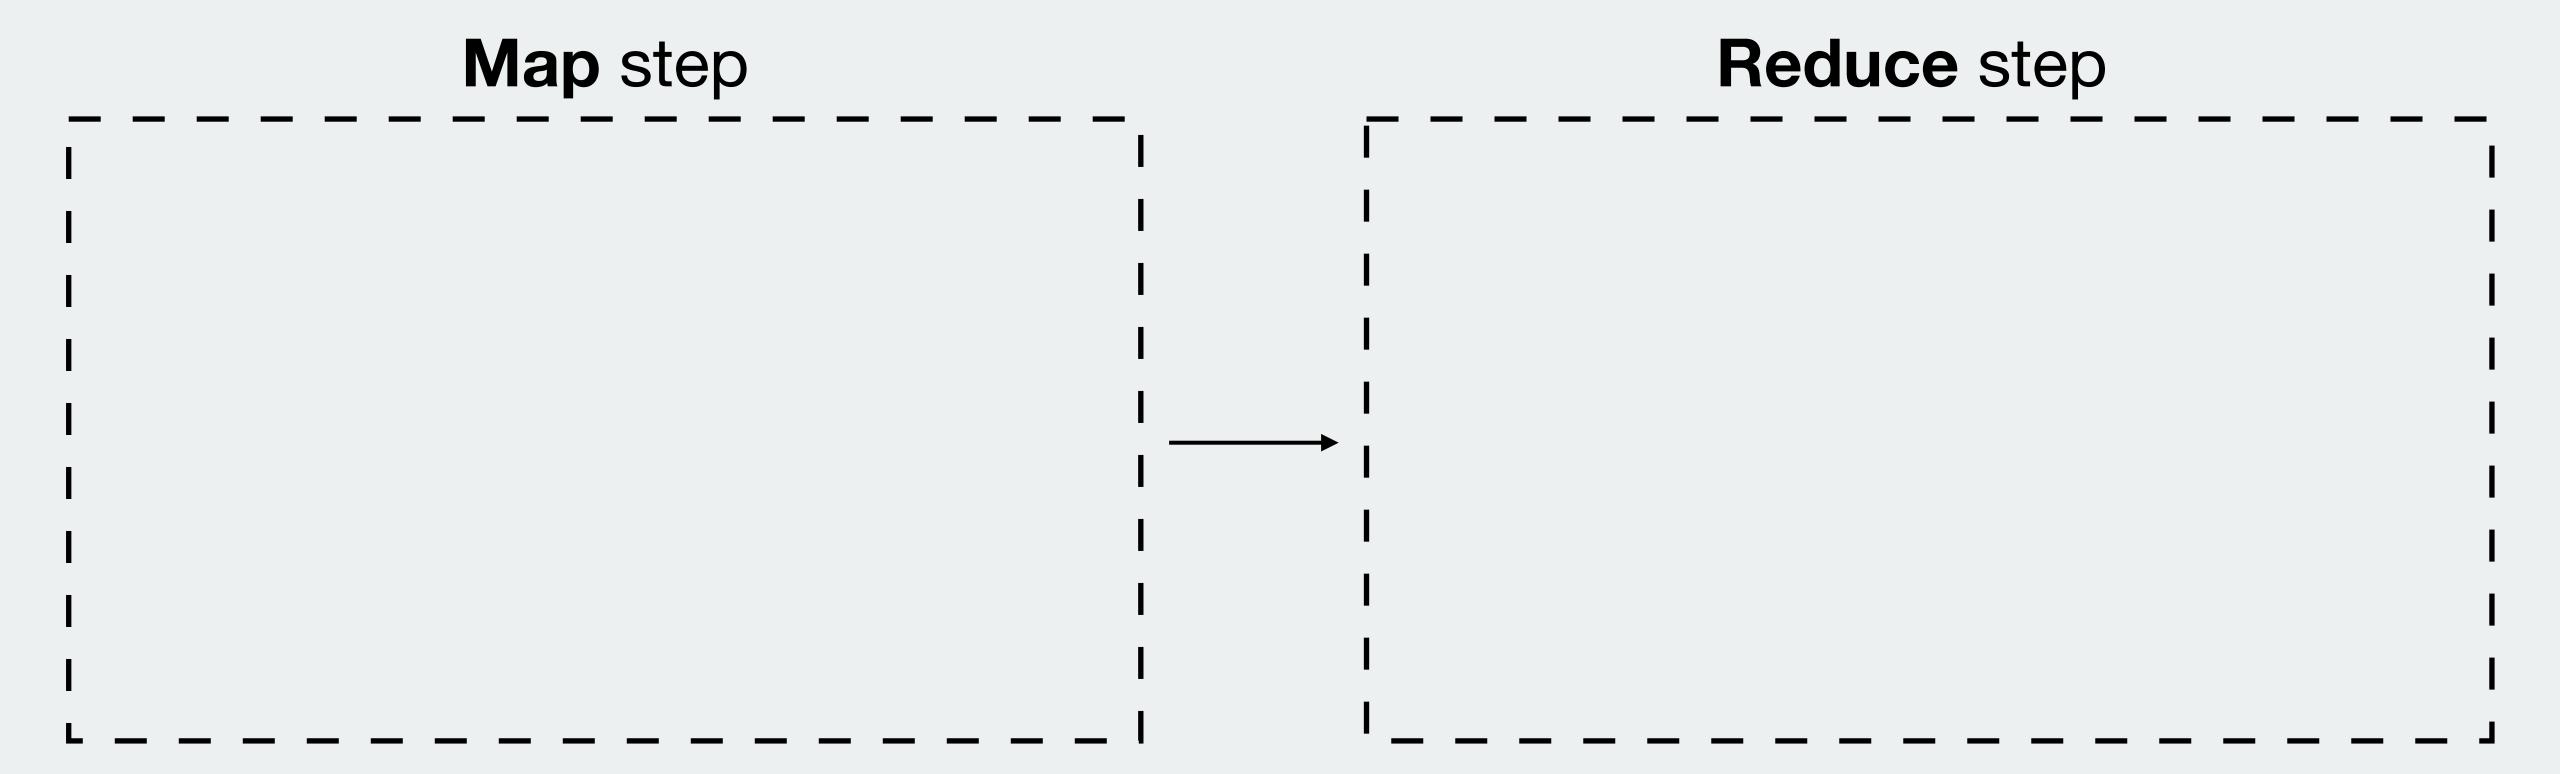

Objective: Count number of occurrences for each word used on twitter

Parallel: Send Python script to multiple databases at a time, which loops over words in the document and increments a central Counter.

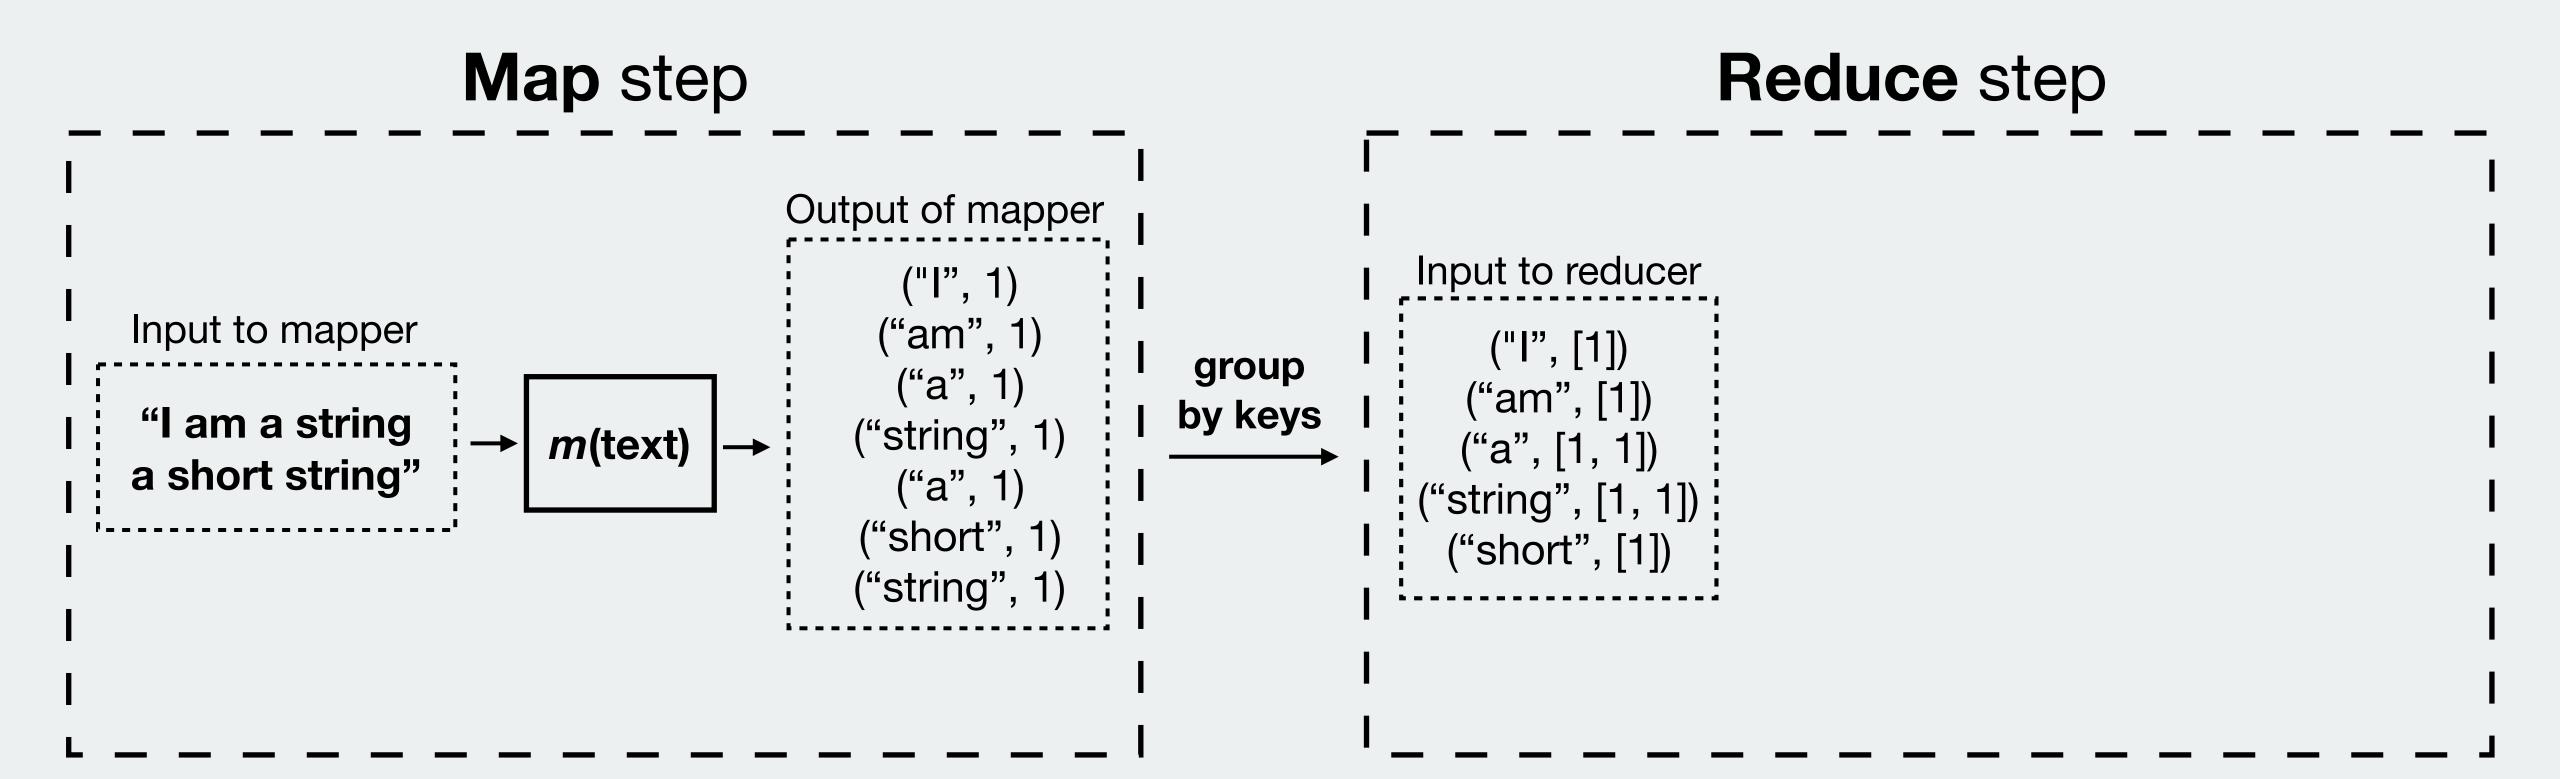

**READ/WRITE ERRORS** 

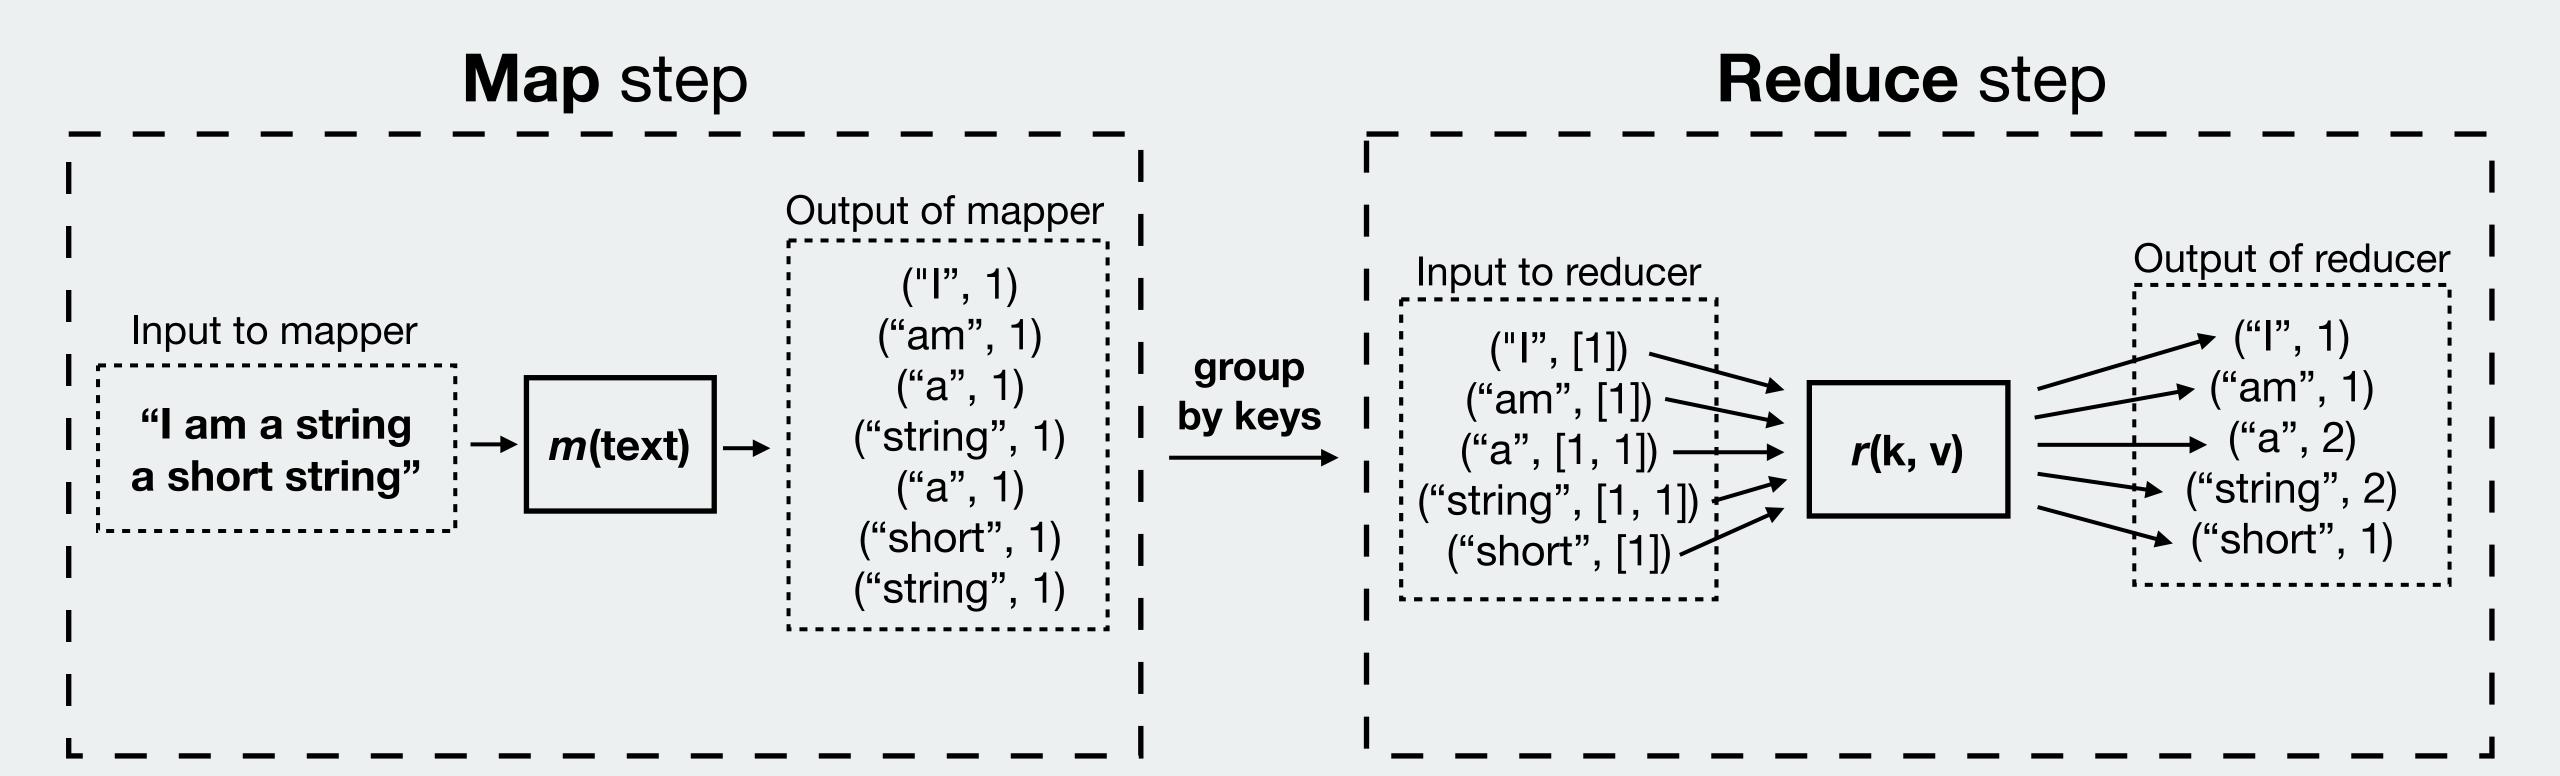

MapReduce in Python O O

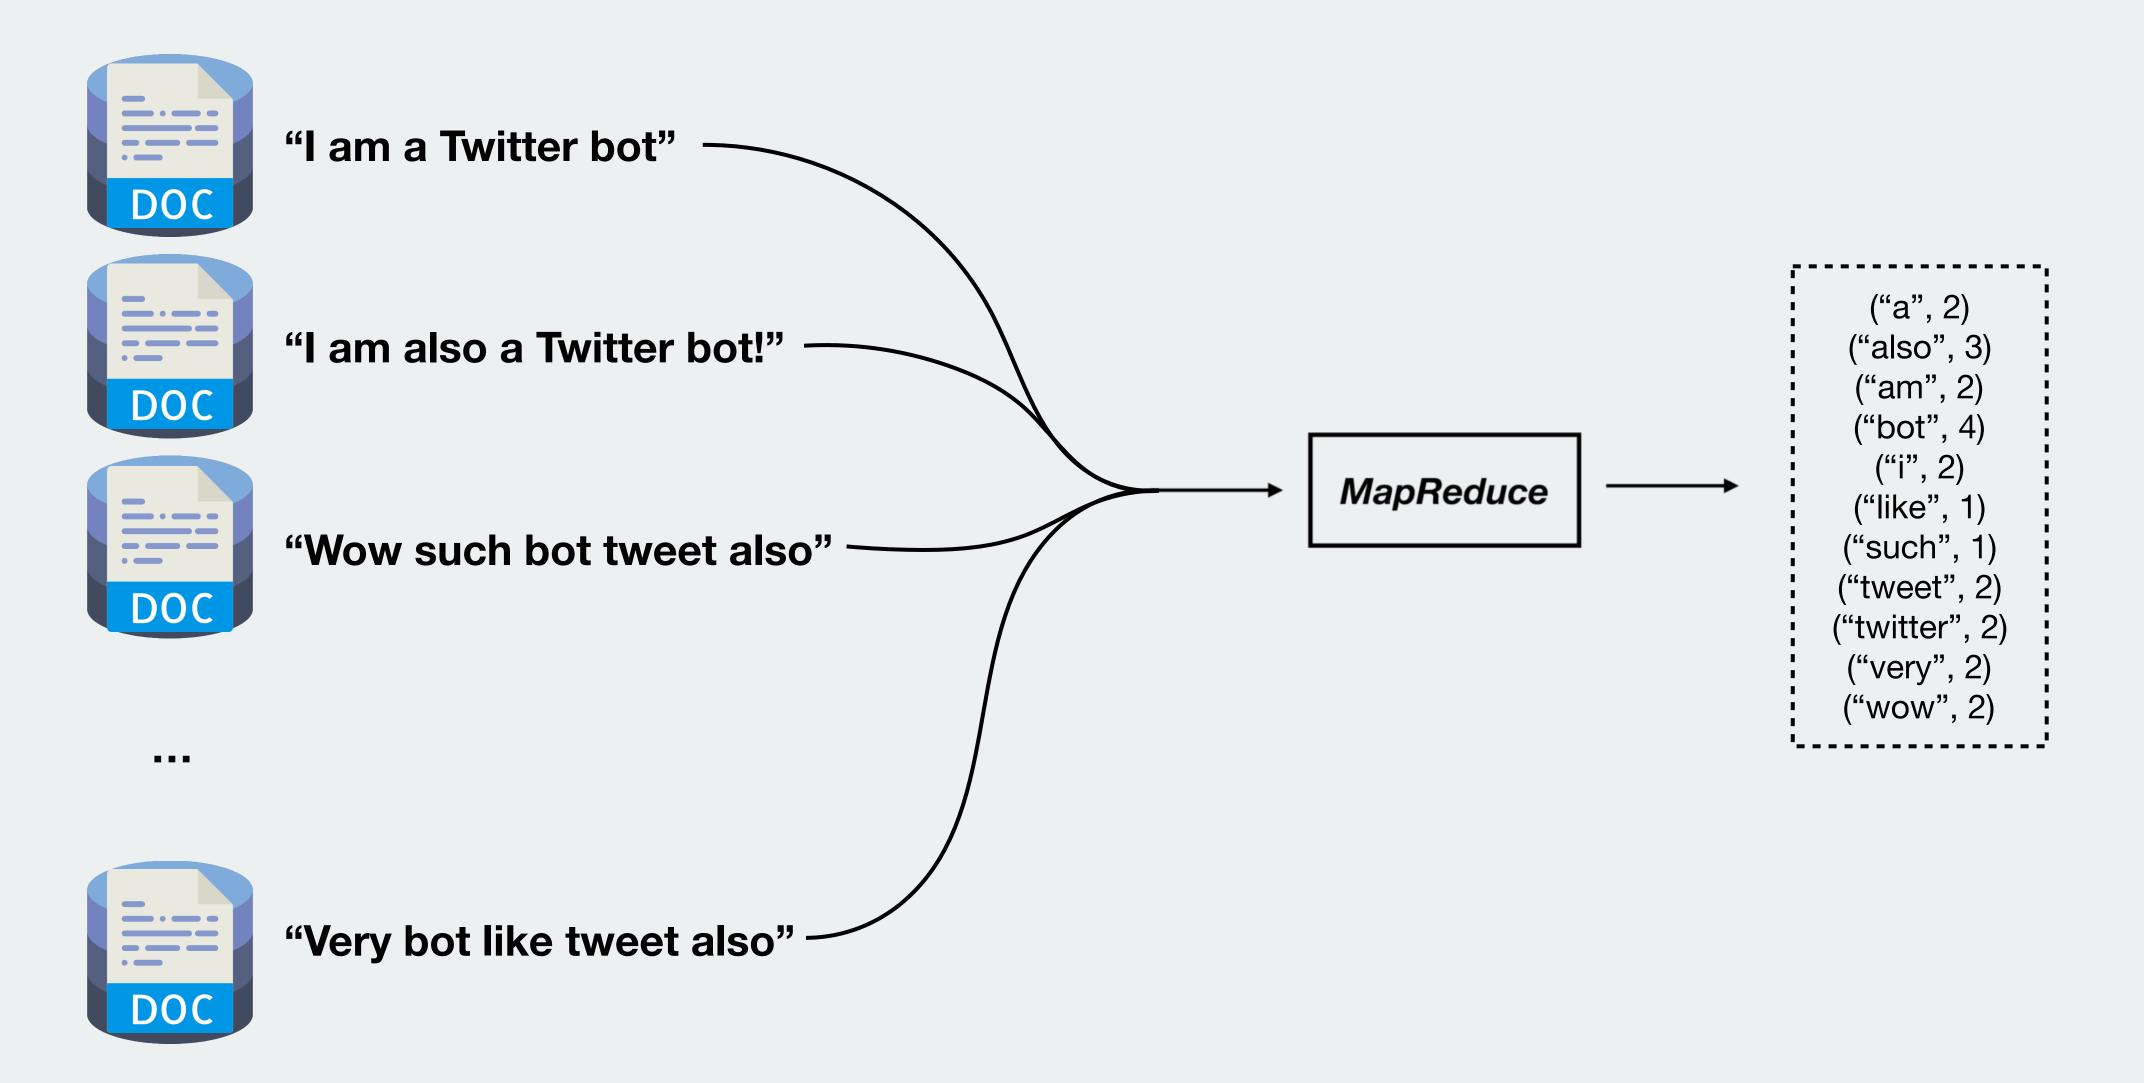

### Word count with multiple documents

### Map step

"I am a Twitter bot"

"I am also a Twitter bot!"

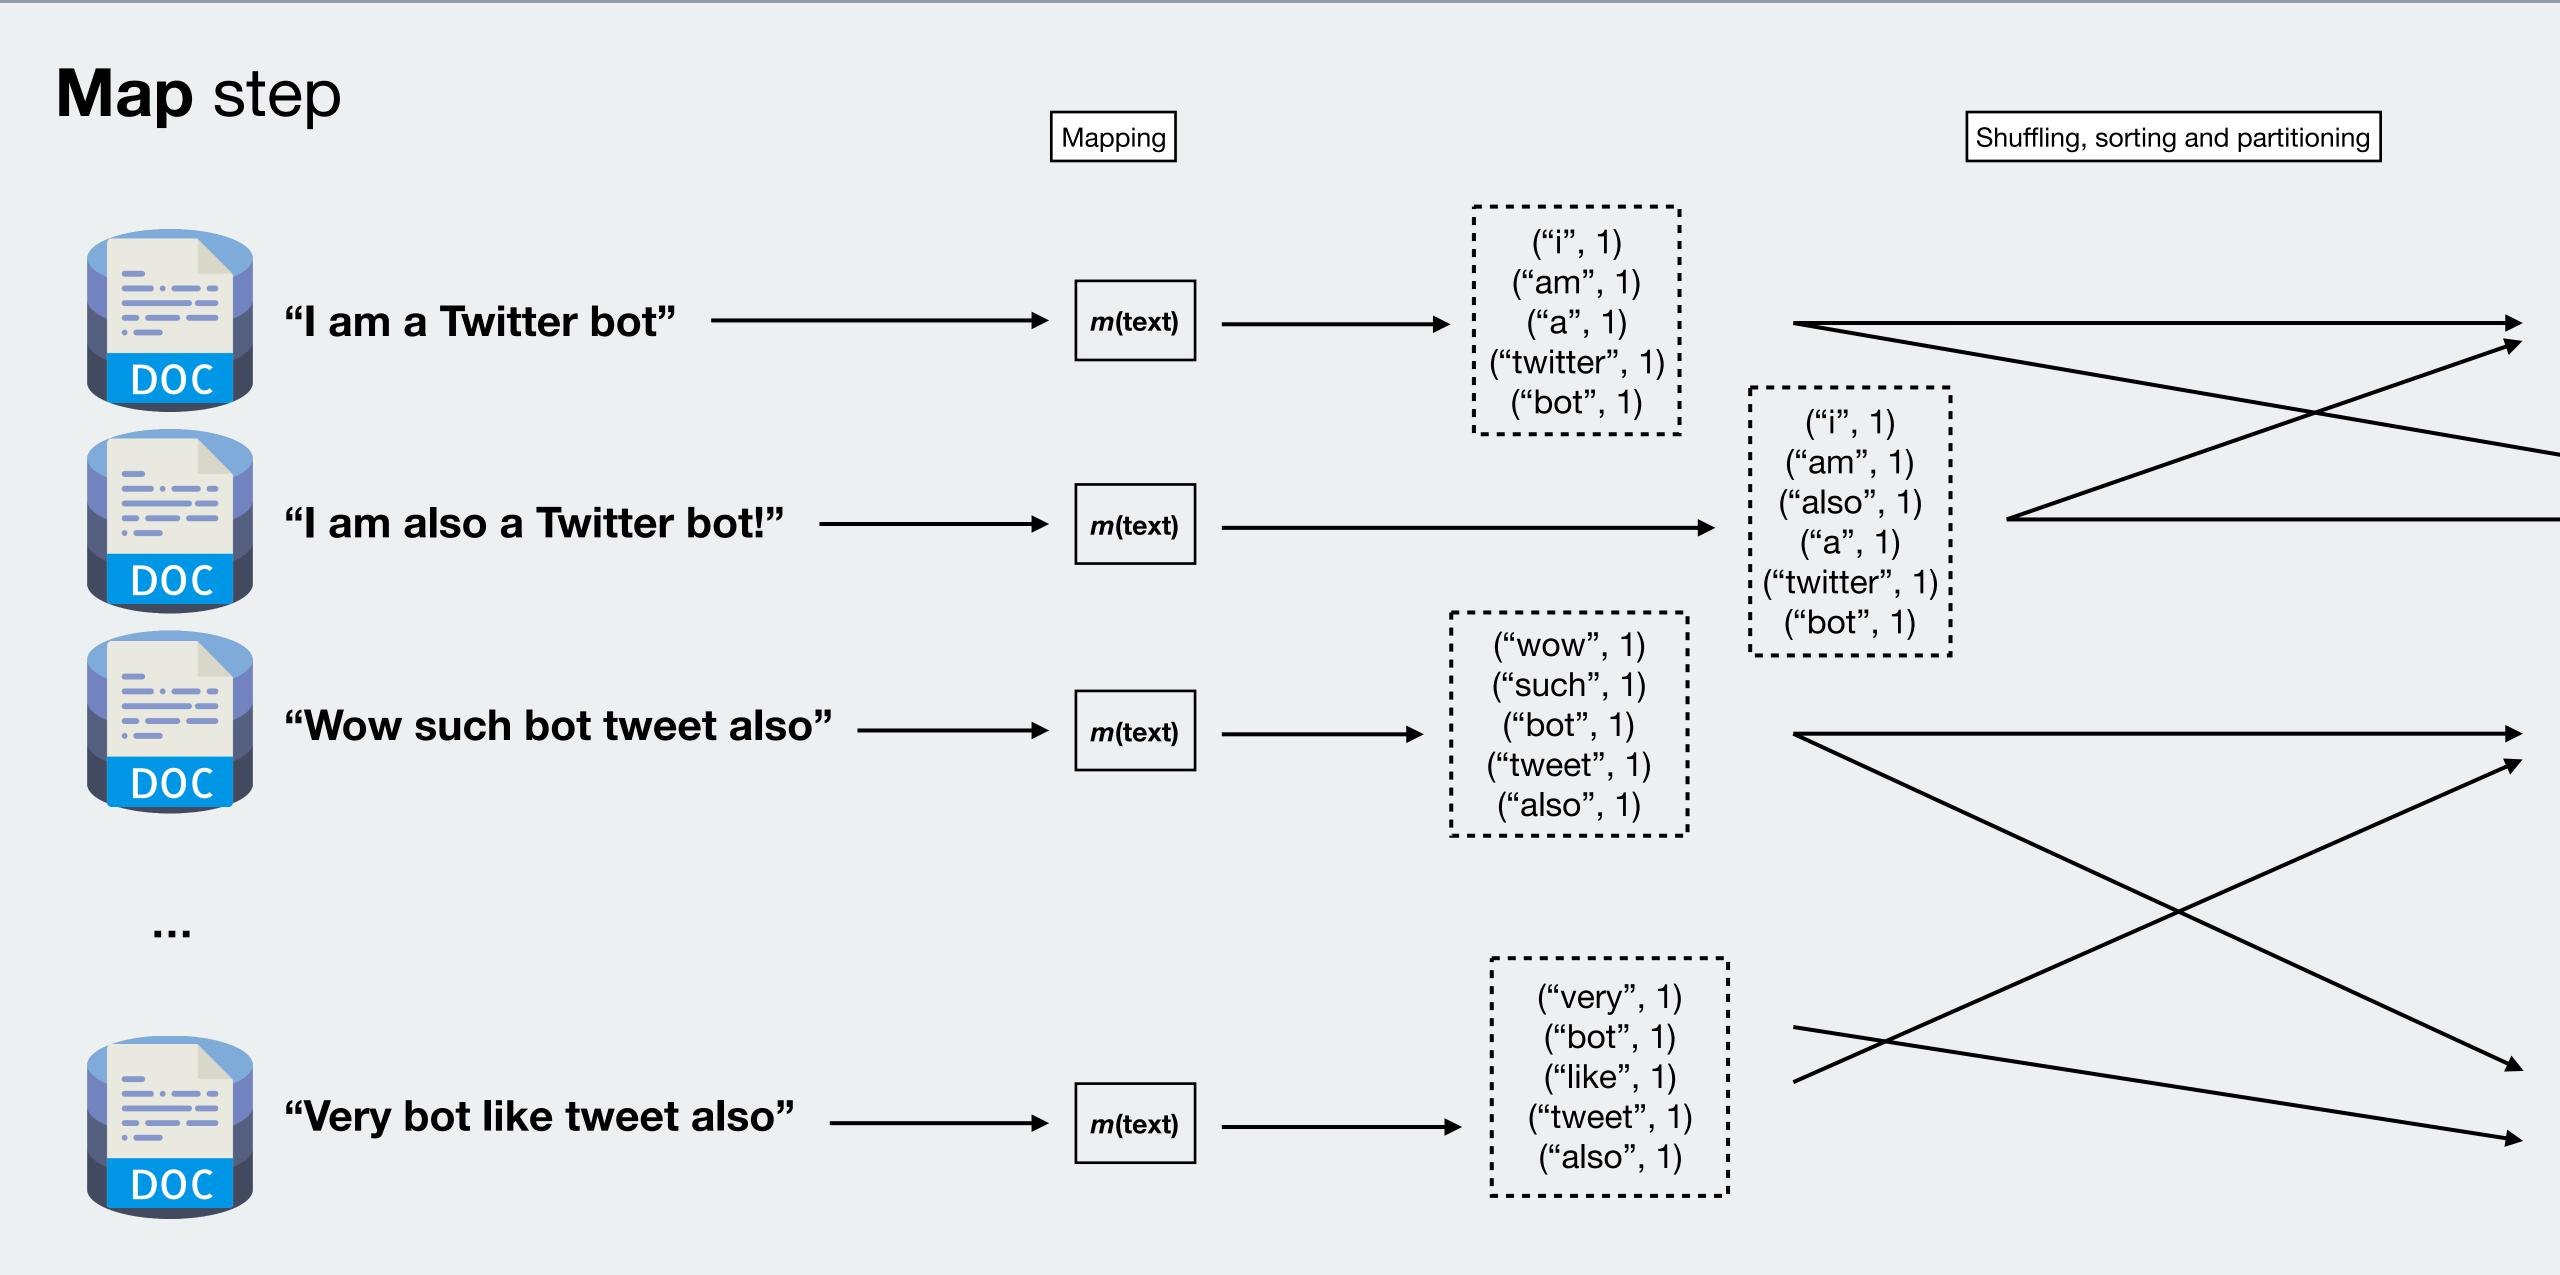

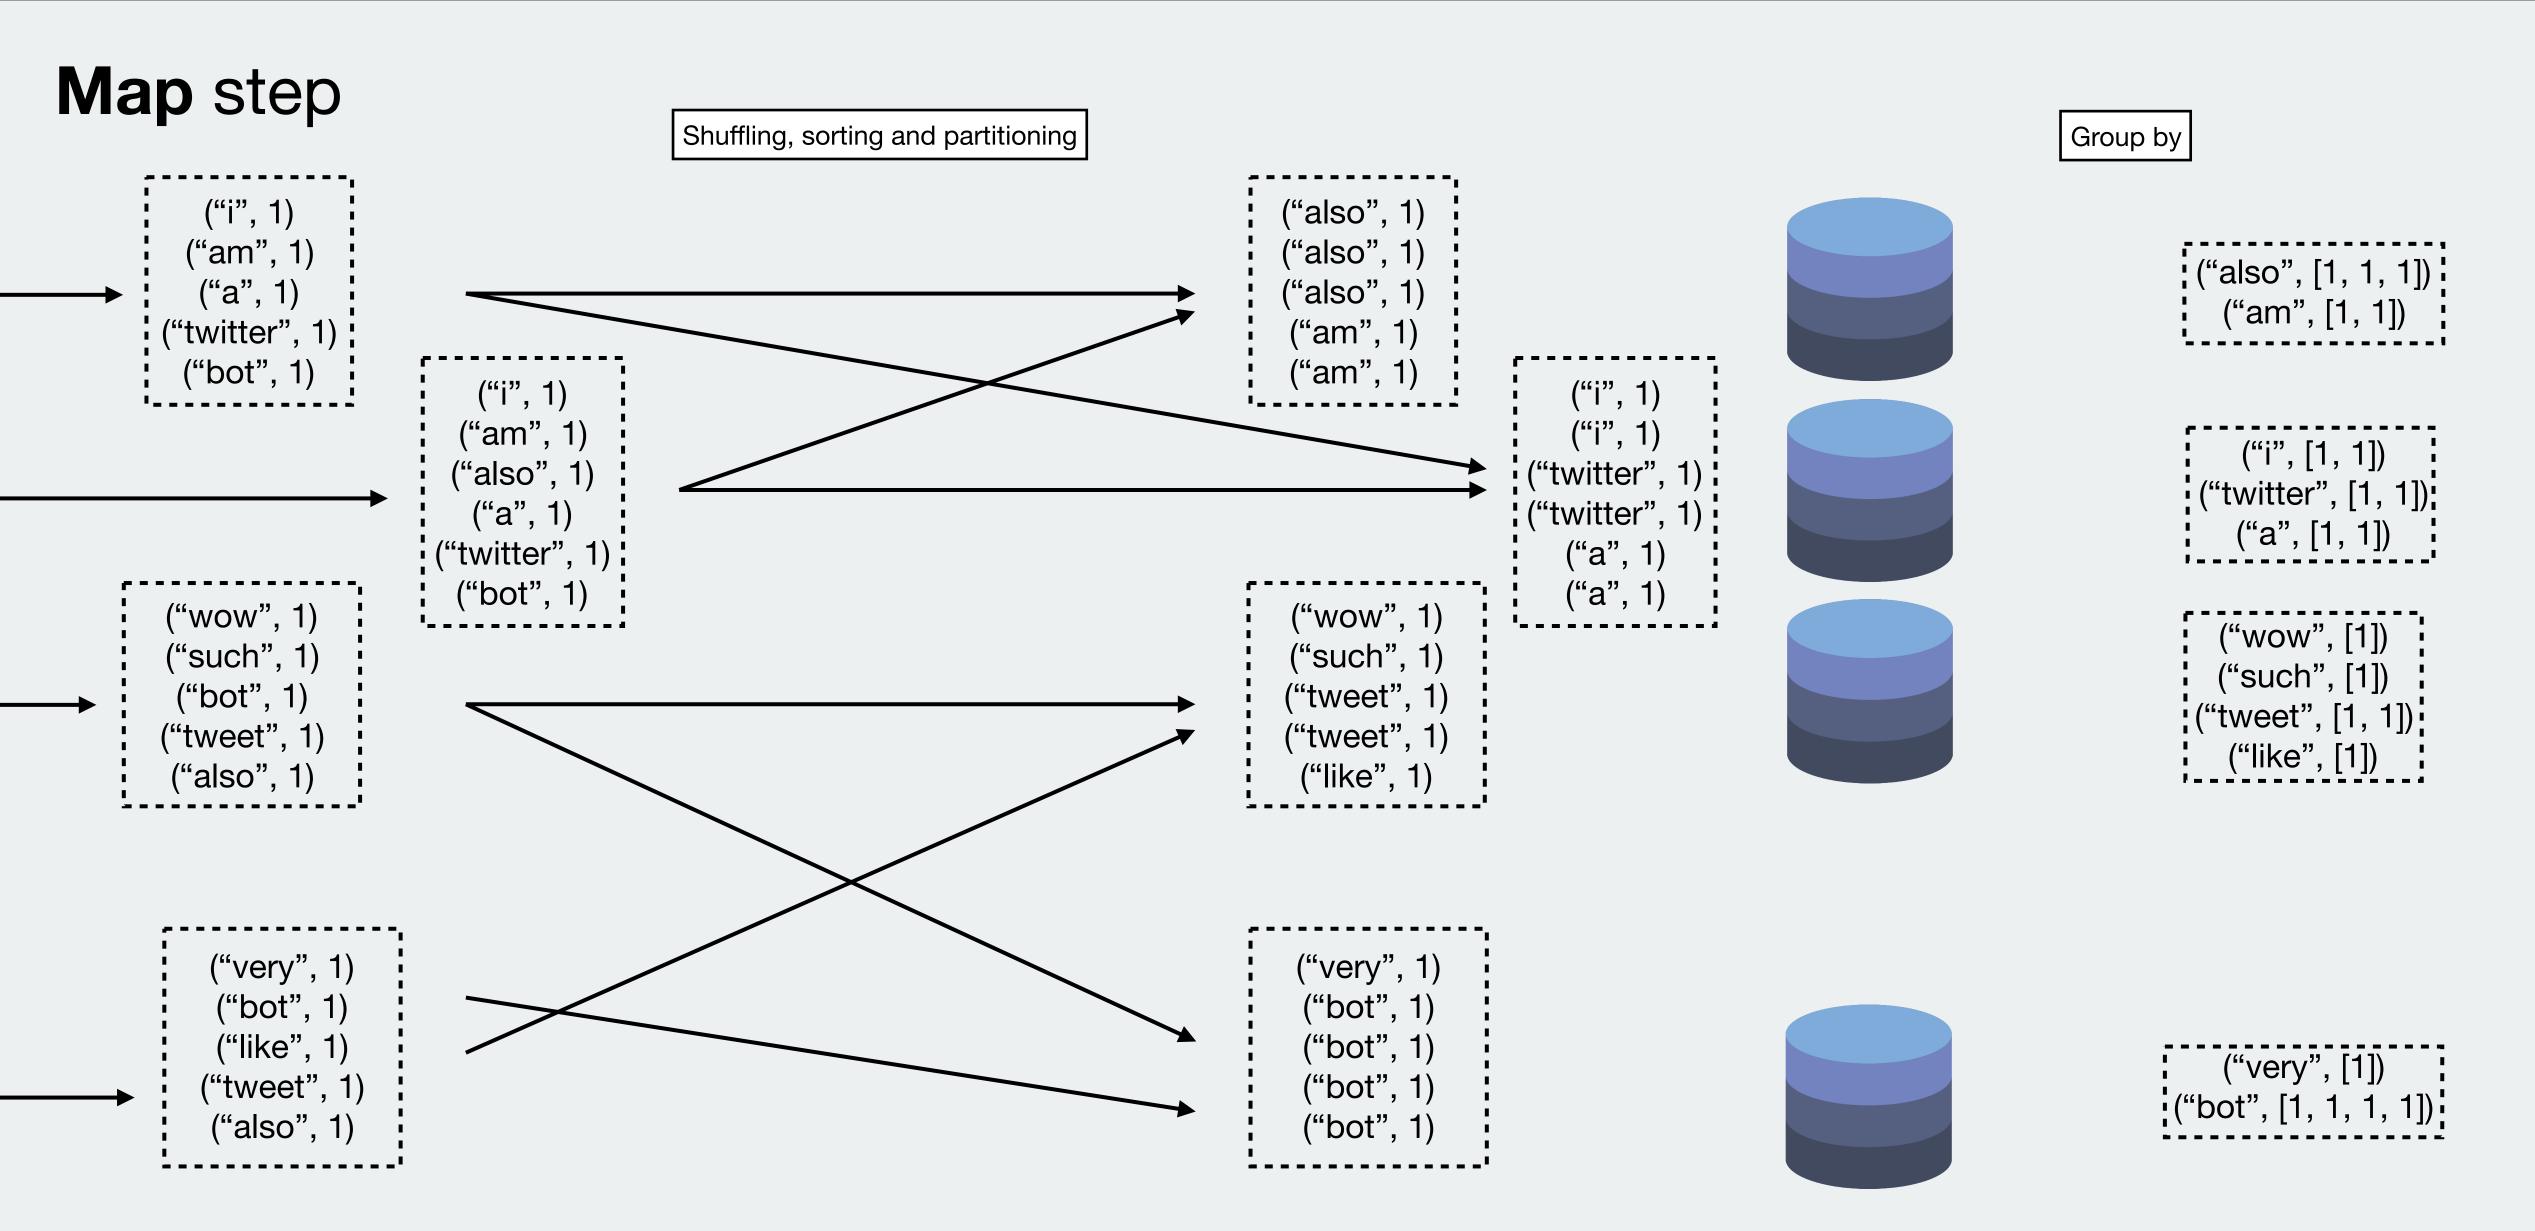

"Wow such bot tweet also"

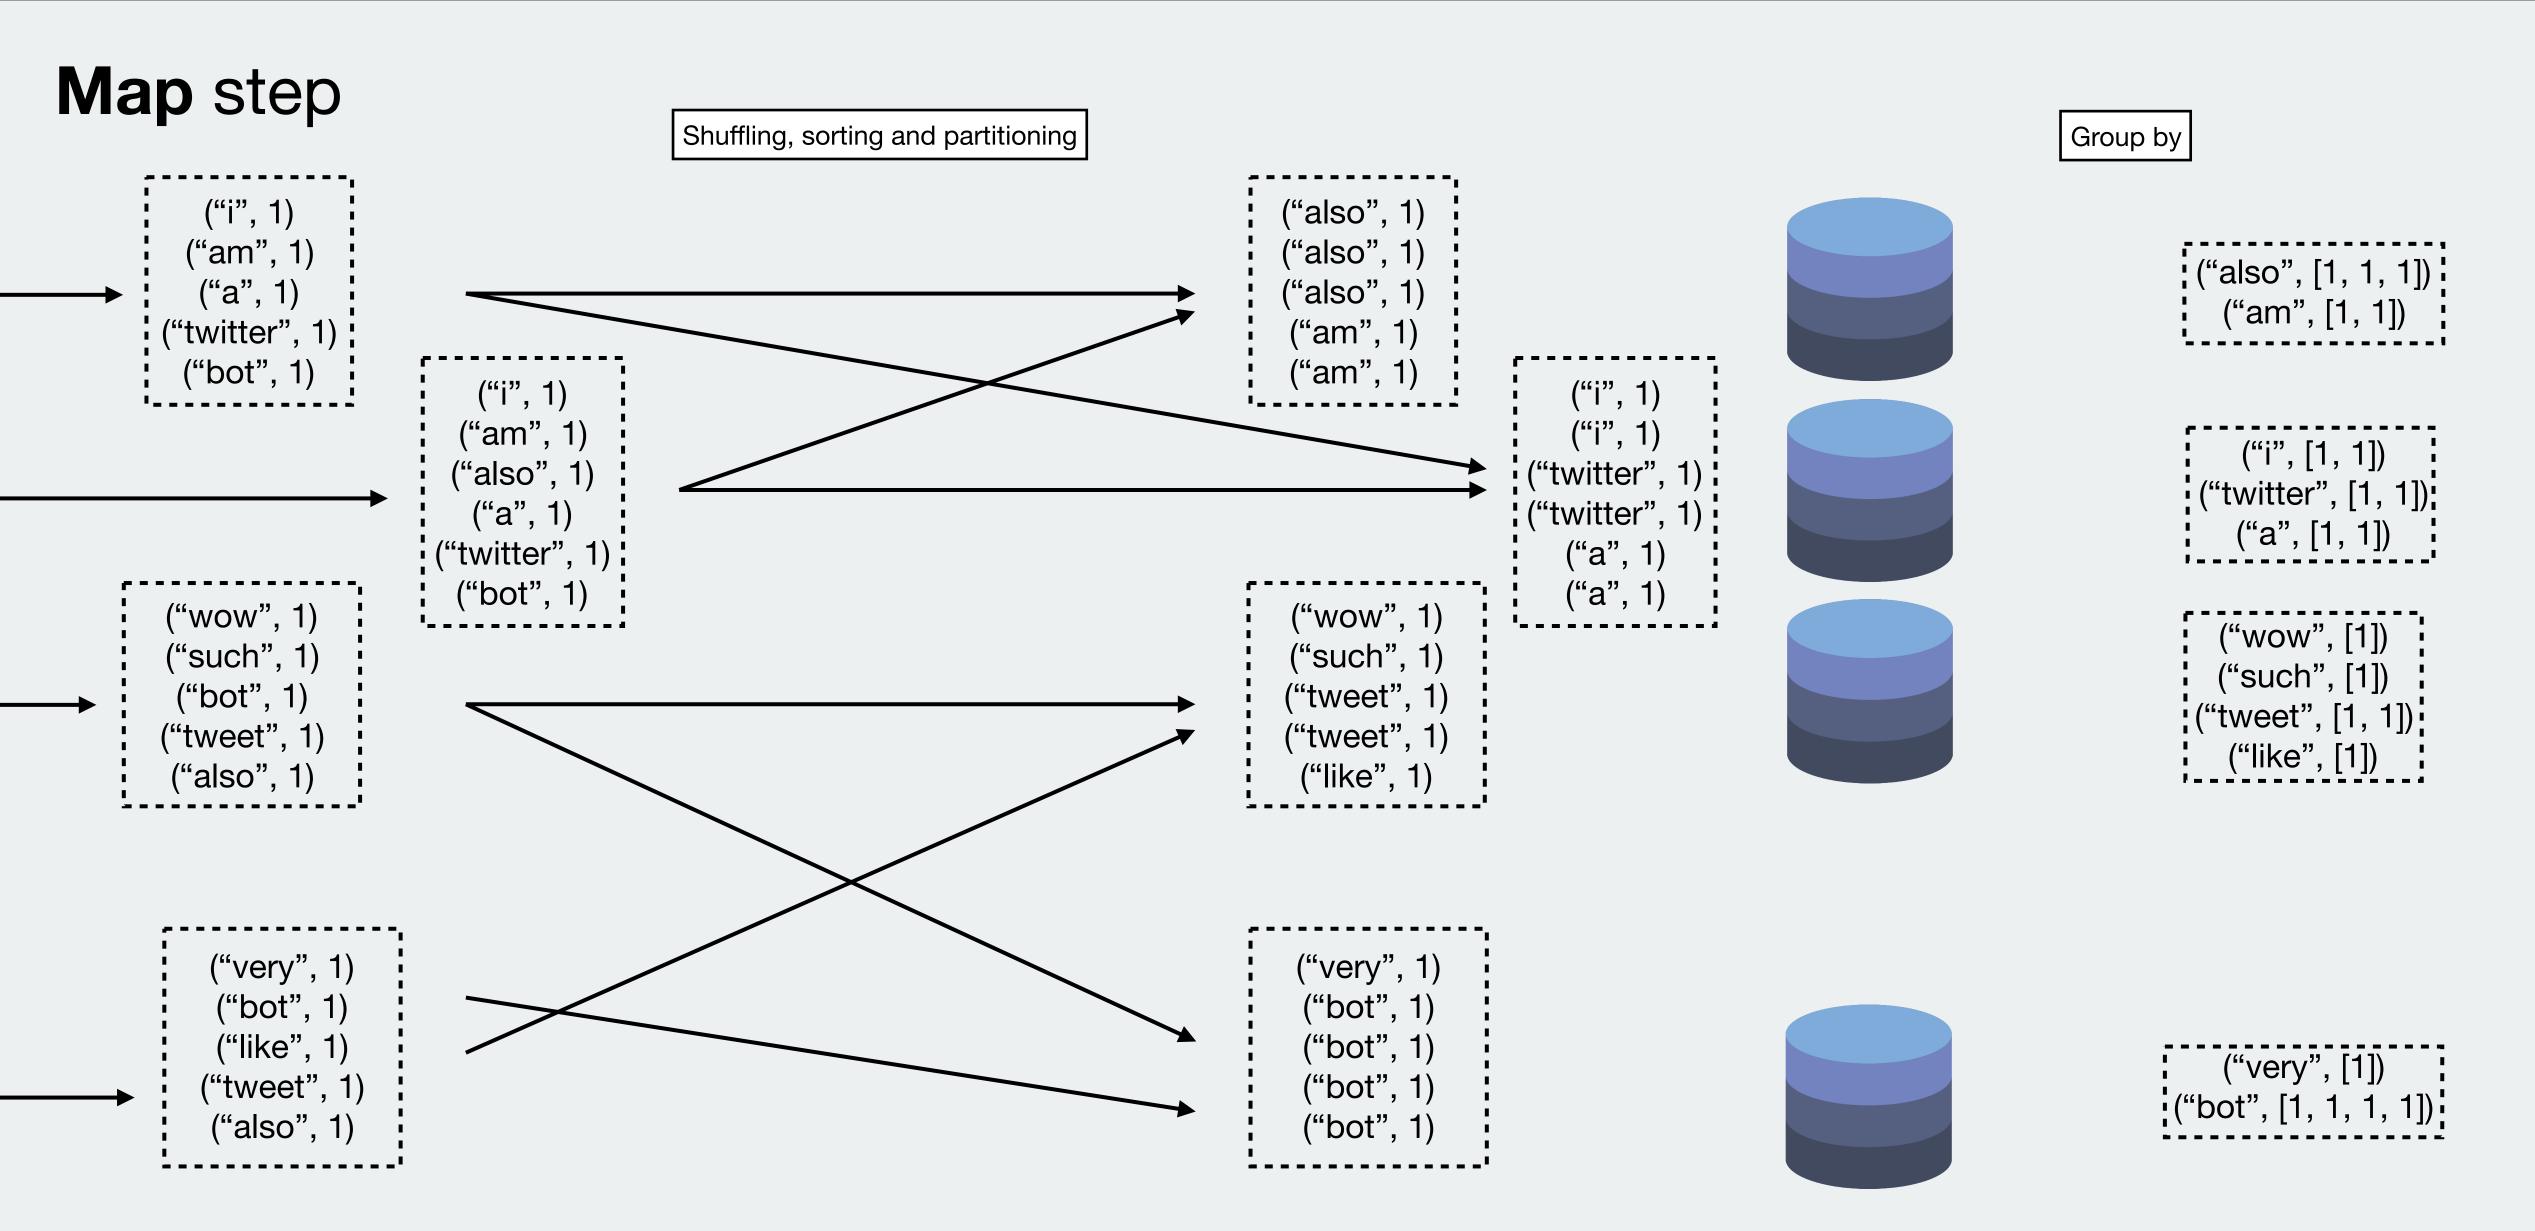

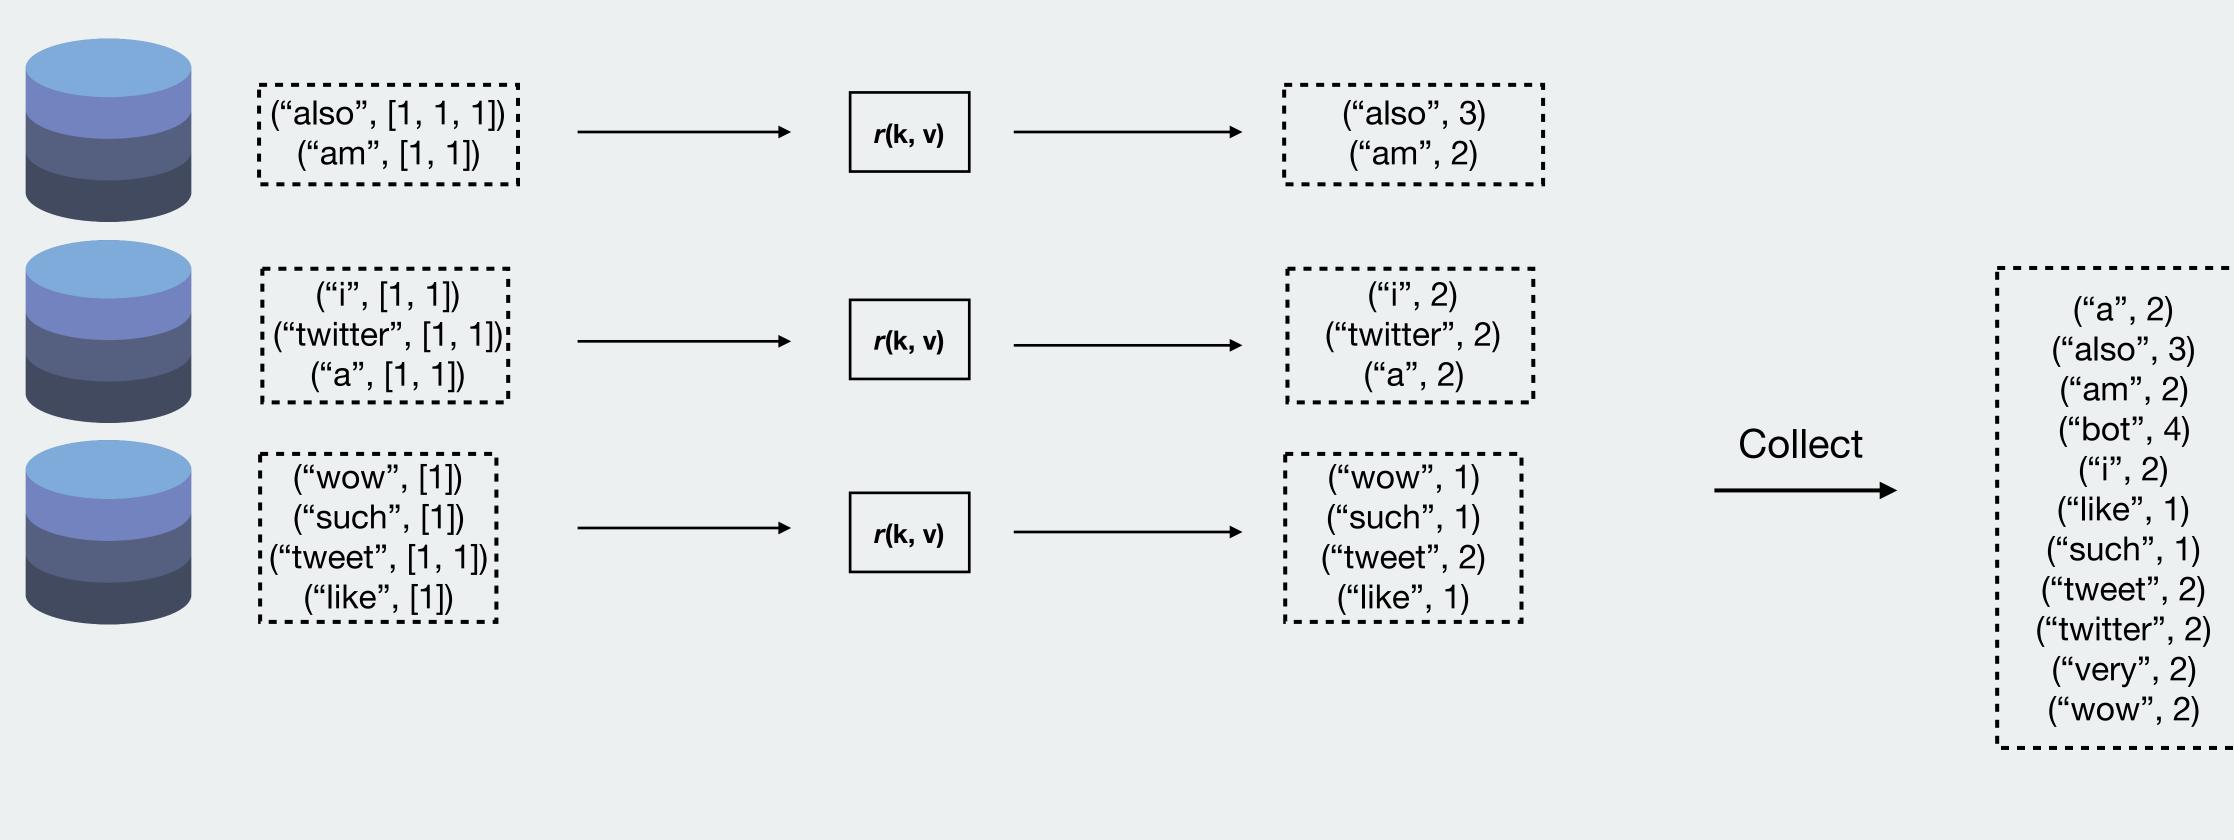

"Very bot like tweet also"

### Reduce step

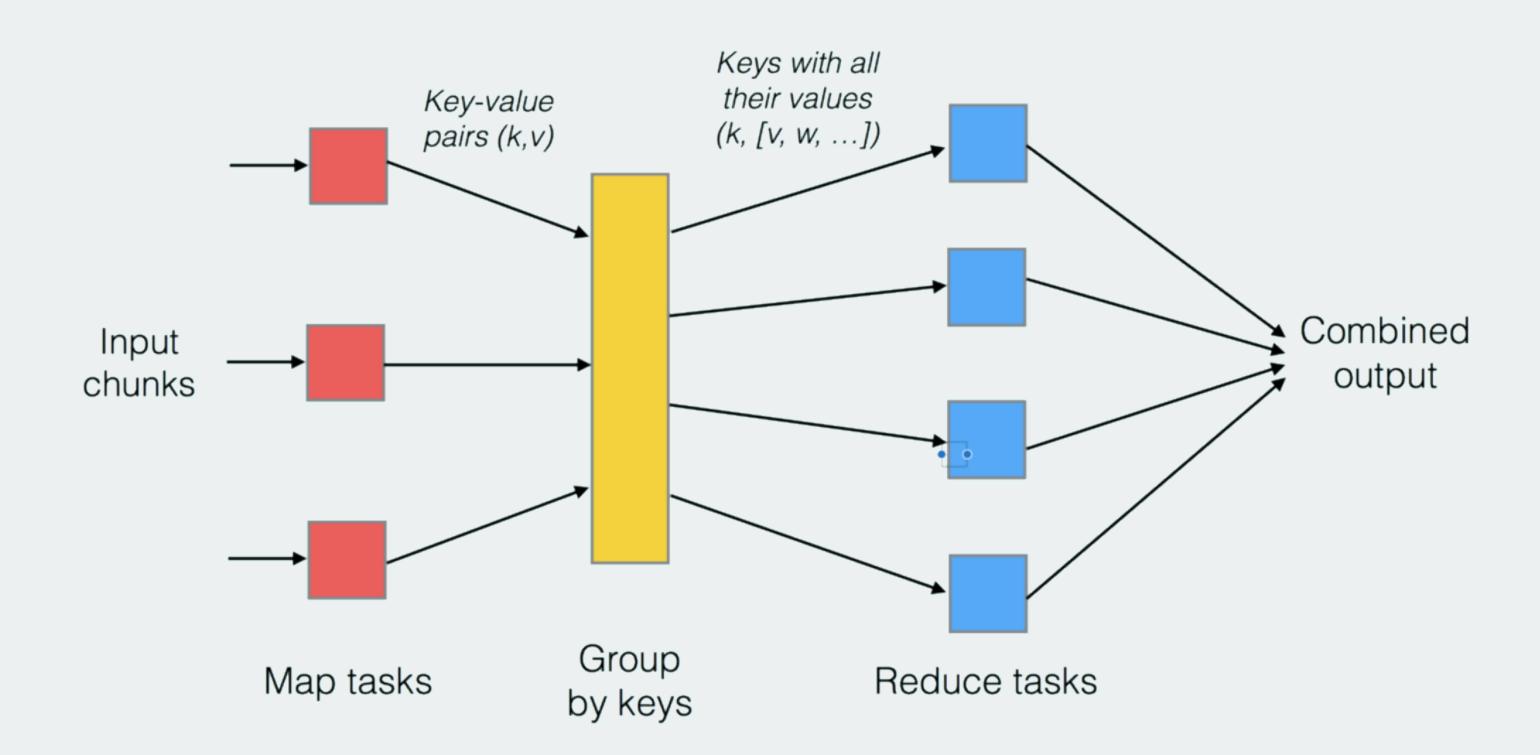

```
("very", [1])
("bot", [1, 1, 1, 1])

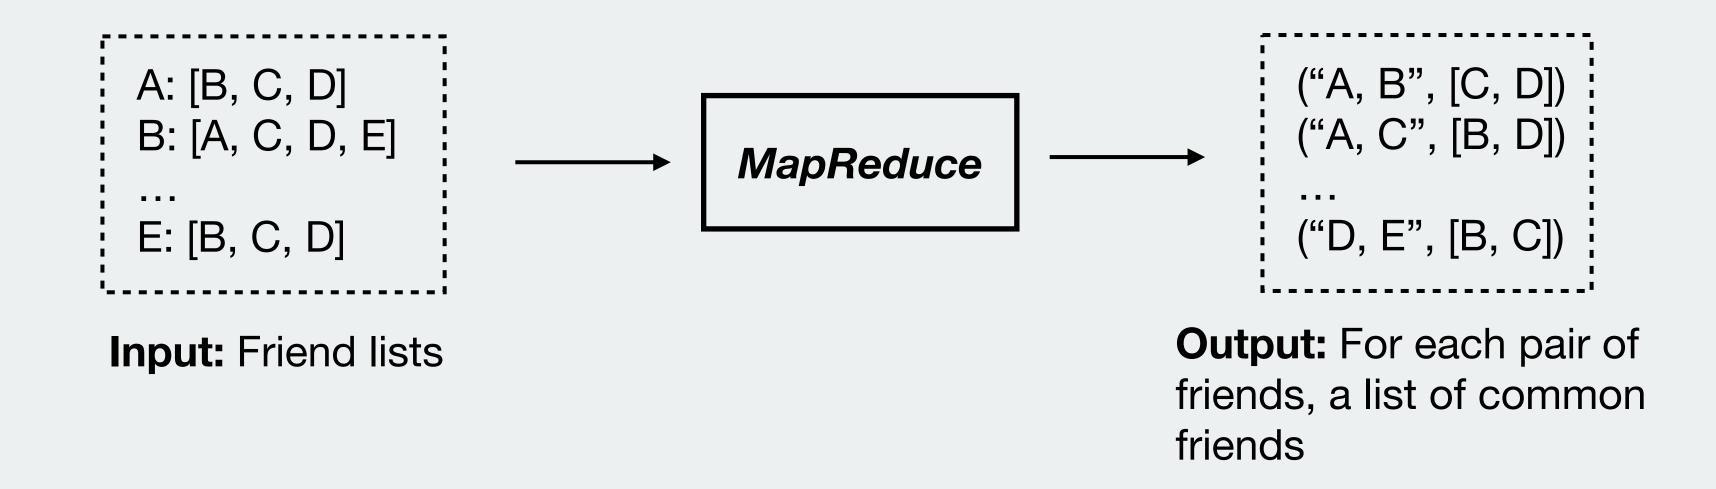

("very", 1)
("bot", 4)
```

### Summary

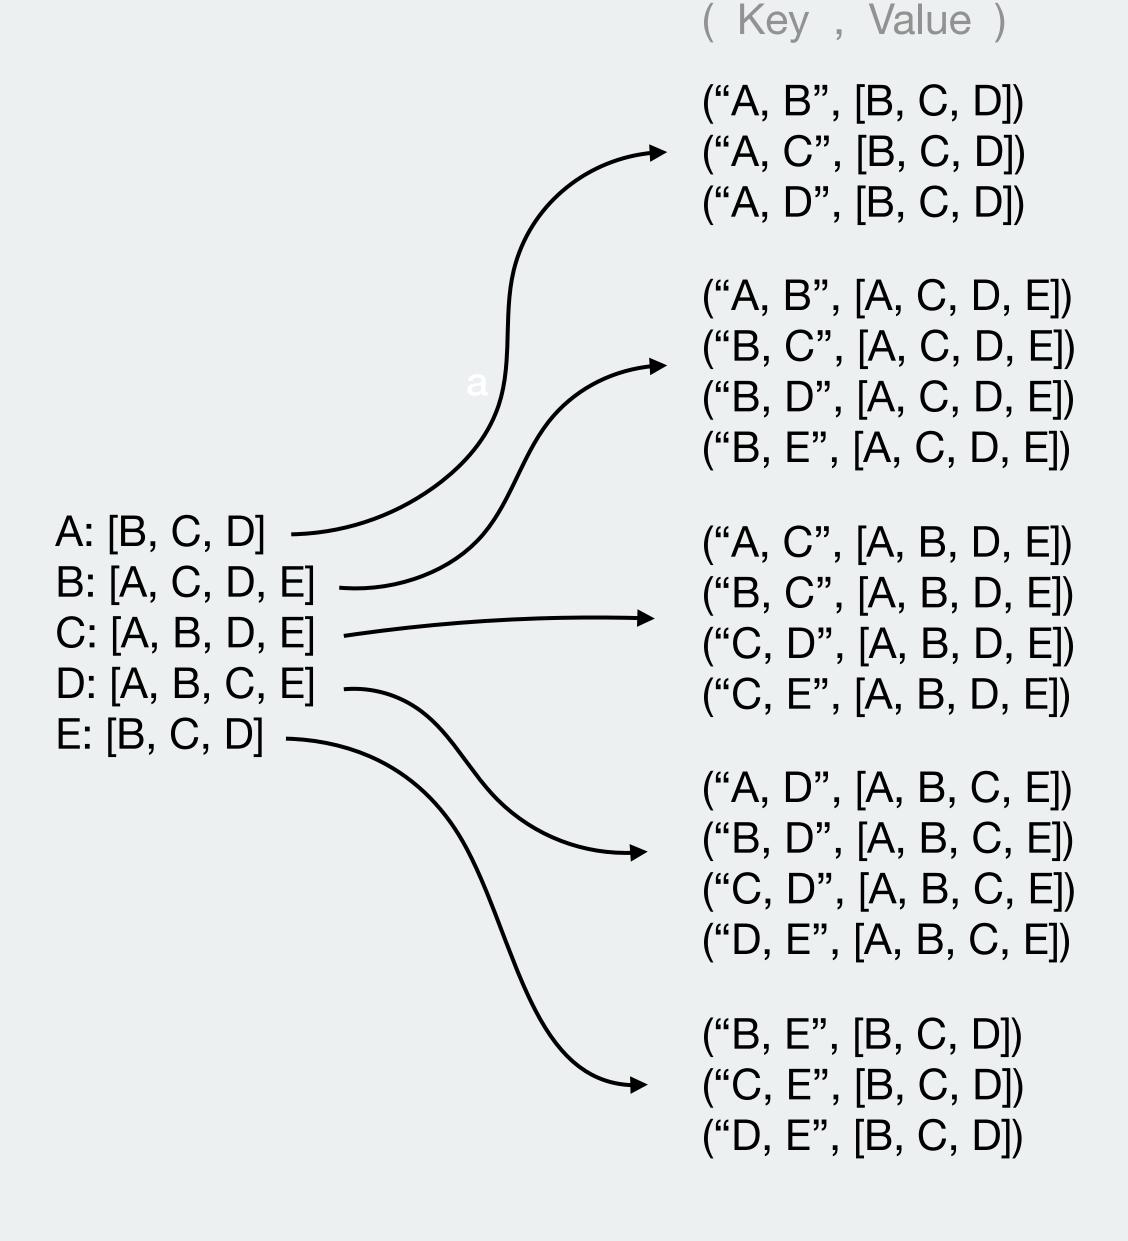

- 1. Map input key-value pairs
- 2. Group values by their keys
- 3. Perform an operation on each key's list of values

### Advanced example: Common friends

### Map step

### Group by key

```
( Key, Value )
("A, B", [B, C, D])
("A, C", [B, C, D])
("A, D", [B, C, D])
                                            (Key, [Value1, Value2])
("A, B", [A, C, D, E])
                                            ("A, B", [[B, C, D], [A, C, D, E]])
("B, C", [A, C, D, E])
                                            ("A, C", [[A, C, D, E], [A, B, D, E]])
("B, D", [A, C, D, E])
                                            ("A, D", [[B, C, D], [A, B, C, E]])
("B, E", [A, C, D, E])
                                            ("B, C", [[A, C, D, E], [A, B, D, E]])
("A, C", [A, B, D, E])
                                            ("B, D", [[A, C, D, E], [A, B, C, E]])
("B, C", [A, B, D, E])
                                            ("B, E", [[A, C, D, E], [B, C, D]])
("C, D", [A, B, D, E])
                                            ("C, D", [[A, B, D, E], [A, B, C, E]])
("C, E", [A, B, D, E])
                                            ("C, E", [[A, B, D, E], [B, C, D]])
("A, D", [A, B, C, E])
                                            ("D, E", [[A, B, C, E], [B, C, D]])
("B, D", [A, B, C, E])
("C, D", [A, B, C, E])
("D, E", [A, B, C, E])
("B, E", [B, C, D])
("C, E", [B, C, D])
("D, E", [B, C, D])
```

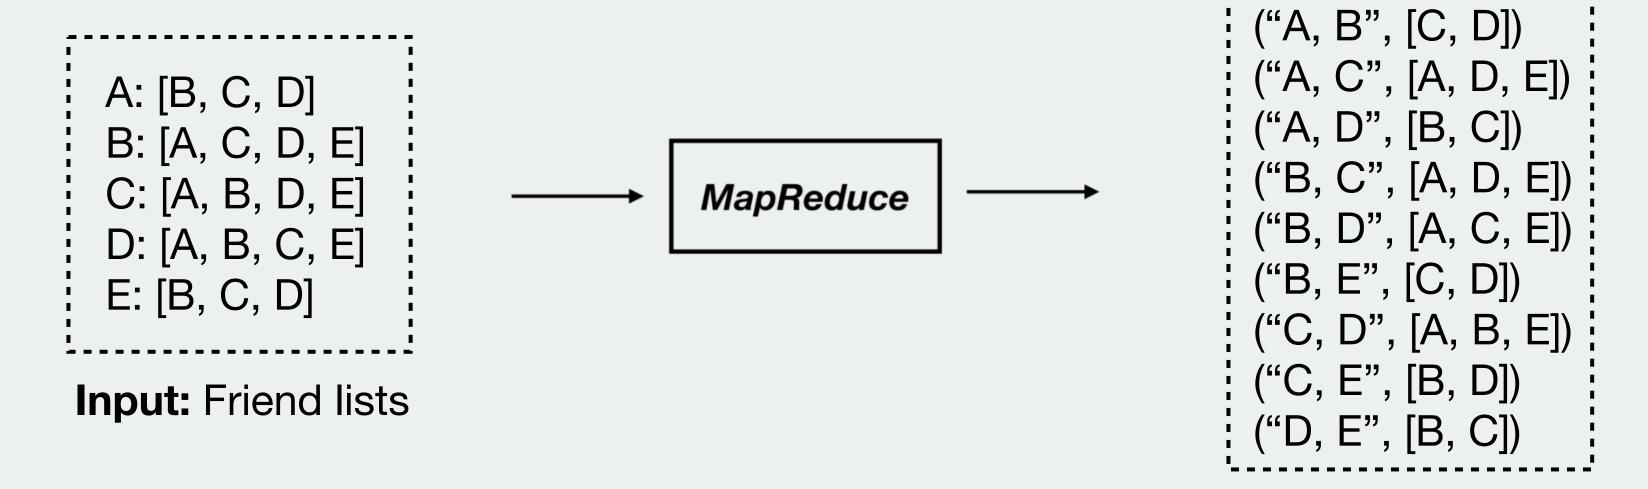

### Reduce step

```
("A, B", [[B, C, D], [A, C, D, E]])
("A, C", [[A, C, D, E], [A, B, D, E]])
("A, D", [[B, C, D], [A, B, C, E]])
("B, C", [[A, C, D, E], [A, B, D, E]])
("B, D", [[A, C, D, E], [A, B, C, E]])
("B, E", [[A, C, D, E], [B, C, D]])
("C, D", [[A, B, D, E], [A, B, C, E]])
("C, E", [[A, B, D, E], [B, C, D]])
("D, E", [[A, B, C, E], [B, C, D]])
```

```
("A, C", [A, D, E])
("A, D", [B, C])
("B, C", [A, D, E])
("B, D", [A, C, E])
("B, E", [C, D])
("C, D", [A, B, E])
("C, E", [B, D])
("D, E", [B, C])
```

("A, B", [C, D])

### Advanced example: Common friends

Output: For each pair of friends, a list of common friends

### MapReduce in Python: mrjob

- Python package that lets you write MapReduce jobs in pure Python.
- Runs on your local machine as well as a Hadoop cluster
- Can also be used to write Spark jobs.

```
from mrjob.job import MRJob

class MRWordCounter(MRJob):

    def mapper(self, _, line):
        for word in line.split():
            yield word, 1

    def reducer(self, key, values):
        yield key, sum(values)

if __name__ == '__main__':
    MRWordCounter.run()
```

MapReduce ● ● ● ● ●

```
from mrjob.job import MRJob
class MRWordCounter(MRJob):
    def mapper(self, _, line):
        for word in line.split():
            yield word, 1
                                              my_script.py
    def reducer(self, key, values):
        yield key, sum(values)
if __name__ == '__main__':
    MRWordCounter.run()
i am a twitter bot
i am also a twitter bot
                                              text_file.txt
wow such bot tweet also
very bot like tweet also
```

```
